Abstract. Today, the way we perceive art has changed from visual observation to an all-encompassing multisensory and interactive experience, and it has become a common occurrence as a result of the combination of creativity, new science, and technology. To investigate how modern multisensory installation art serves as a transformative form of creative expression that focuses on light, space, and individual experience, the study examines James Turrell to understand the environment. The paper gives an introduction to James Turrell's artworks, which give spectators a different perception and allows them to participate actively. In this order, a mixed approach was used, with a questionnaire of 250 participants to assess sensory reactions and the reported experience of connecting with the light; the study gives an empirical viewpoint to illustrate immersive installation art. The strong involvement of the responder's about integrated light and sound's ability to enhance a blended sensory experience is revealed by the empirical results.

Keywords: Multisensory Installation Art, Light Art, James Turrell, Contemporary Art, Psychological Immersion.

1 Introduction

Today, art has kind of moved into different mental environments where you find yourself having an important part to play, not just as passive students but as active players. Art can mean several things. Everyone's perspective is slightly different. And that creates this little paradox: people see it differently because their memories, emotions, and even historical background keep steering how they respond.

A lot of the time, art seems to be something that is in real life, rather than having fixed structures or rigid bounds. Instead, it is more like a big, well-planned area that enables people to stroll about, observe, or even completely immerse themselves in what is being displayed. This paper's main focus is installation art. Works that are made especially for a site or purposefully positioned in a fixed location are the foundation of installation art. These pieces are intrinsically linked to their intended location from the very beginning of their creation; moving them would deprive them of their original significance, in contrast to oil paintings or sculptures that may be relocated to any exhibition hall at pleasure.

This art form experiments with a wide range of creative media, exploring the interactive effects that emerge between these media and the surrounding spatial environment. Creators do not limit themselves to traditional artistic materials such as pens, paper, or canvas; in fact, they try to experience experimental works with light, sound, and shadow that give the viewer a different view of the artwork, and also use furniture as a unique chemical reaction. From this perspective, installation art constitutes a revolution in the art world. It has transformed the way people perceive all things, and even scientific discoveries fall among the things that have been redefined through this new mode of cognition.

In multisensory art, light plays an important role [1] in shaping the perception and atmosphere of visual space. Its interaction with the surrounding environment can create qualities such as depth, enclosure, and dramatic effect, influencing how viewers experience and aesthetically perceive a space. [2] Through new materials, media, and audience engagement strategies, technological advancements in the twentieth and twenty-first centuries have broadened creative techniques. This change was mirrored in the rise of the Light and Space Group in Southern California in the 1960s, when artists began experimenting with illumination, space, technology, and even perception. Though they took varied approaches to light, artists like Mary Corse, Fred Eversley, and James Turrell were all interested in how the audience saw the piece. Their methods helped to change the concept of art from an object to an experience where perception and experience are actively shaped by light as well as space.[3] Studies on the creative use of light and shadow reveal a change from their representational purpose to their influence on perception. Light is viewed as a physical component that has the power to alter spatial perception in James Turrell's Dark Spaces. Turrell creates an environment where spectators become conscious of their own act of seeing through a carefully calibrated interplay of light, shadow, and perception. Thus, his art shows how light may serve as a perceptual and spatial medium, enhancing the viewer's perception of the piece.

The curriculum offers an integrated approach. Even though the study discusses how multimodal installation art uses light, space, motion, and other sensory characteristics to interest viewers, further research is needed to fully understand the viewer's real perceptual and psychological experience.

1.1 Research Design

The goal of the study is to examine the multimodal art experience using light, space, and sensory integration.

Additionally, there is a lack of empirical research on how viewers experience light and sound in multisensory art installations; specifically, they only looked at James Turrell's perceptual effect on light and space. However, there are studies related to multisensory art that show bodily engagement [4] and questionnaire research regarding the same [5,6]. Thus, employing James Turrell's light-based approach as an artistic case scenario, the study closes this gap through questionnaire investigation.

2 Literature Review

A Sensory Design in Interactive Visual Art Practice in India Chamoli, [7] provides information that multisensory and sensory design turn viewers from passive spectators into active participants, creating embodied and emotive experiences, according to research on Indian interactive visual art. Nonetheless, there is still a dearth of comprehensive studies on audience reactions and sensory aspects of Indian art. [8] Since the 1960s, light has been used more and more as an autonomous creative element by artists rather than as a tool for lighting or depiction. Artists may now investigate the connection amongst light, sight, space, & spectator experience thanks to this advancement. A pivotal player in the Light and Space movement, James Turrell specifically studies how artificial and natural light may alter how we perceive space and raise viewers' perceptual attention. According to scholarship by Gover [9], installation art emphasises the interaction between artwork, environment, and audience by moving away from the independent art object and towards spatial, contextual, and viewer-oriented experiences. This offers a starting point for analysing installation art as an immersive and experiential art form. The spectator's experience results from these elements working together, making emotional and embodied engagement central to aesthetic appreciation. This provides a useful conceptual basis for examining affective responses in contemporary installation art. According to [10], the viewer's physical interaction with space, surroundings, and temporality is emphasised in installation art scholarship. The interaction between the body and space becomes crucial to perception, and a phenomenological viewpoint emphasises how moving through an installation creates consecutive micro-experiences. A transcultural relationship between installation art, experiential perception, and aesthetic experience is further supported by the consideration of Asian approaches. [11] Human-technology interactions are increasingly being studied as relational and embodied experiences in HCI and interactive sound installations.

The idea of the "materialisation of light" explains how space and light may interact to influence how a viewer perceives and interacts with their surroundings. [12] Artists like James Turrell, Dan Flavin, Robert Irwin, and Larry Bell investigated light as an experiential medium rather than just an illuminating component, emerging from the Light and Space movement of the 1960s. This method emphasised the connection between light, space, and physical experience while placing the viewer's senses as an active part of the artwork. The study by the author [13] argues that James Turrell's attention to light and spatial perception can demonstrate light as an artistic medium for shaping perception, transforming spaces, and giving, through perceptual phenomena, including the camera obscura and trompe-l'oeil techniques. For this, the analysis synthesizes light, color, and nuanced sensory cues. As with the above [14], through a participant-based study with 143 respondents, recent empirical research has investigated the lived experience of James Turrell's Skyspaces. The study examined several forms of visual experience, embodied thinking, and well-being using pre- and post-experience questionnaires. The results showed that while transformational experiences were more commonly found in the Skyspace condition, Skyspace experiences were linked to higher levels of emotional and cognitive activity. Crucially, the study discovered that

the kind of encounter was a better indicator of aesthetic and wellbeing results than the actual geographical location.
Similarly, [15] Research on sound installations demonstrates that sound can actively shape users' experience and perception of public spaces. From the same view, [16] integrates creative work with empirical observation to comprehend users' perceptions in public places using sound installations that can improve users' involvement and overall experience of a location, according to studies that used surveys, sound-level sensors, and iterative design procedures. [17] Through the transformation of noise, stillness, and vibration into communal sensory experiences, sound-based artworks may show how sound affects body perception, social awareness, memory, and interaction with political and geographical surroundings. [18] Diverse approaches to artistic aim, interaction, and system design are identified in a systematic analysis of interactive sound installations, emphasising the growing use of various sound-based tactics and numerous sensory modalities in modern installation practices [19]. By showing how interactive listening and qualitative interviews can reveal a variety of perceptual experiences of spatial and sound-based artworks, research on sound art documentation emphasises the consequence of including sensorial participation and participant responses in the study.

3 Methods

3.1 Research Design

The work takes a quantitative and qualitative approach, combining a qualitative case study of James Turrell, a literature review, and a quantitative questionnaire analysis to produce thorough findings.

3.2 Data Collection

Through an online Google Form, the study gathered data from around 253 participants, including young students, independent artists, academics, and artists from art galleries and higher education institutions with both fine and non-fine art backgrounds. The survey was sent out via electronic means.

3.3 Questionnaire Design

One question about the perceived link between light, sound, and sensory perception in art installations made up the data-gathering tool. Do you think that a light and sound in an art installation creates a blended and well-balanced sensory experience?
Hence the question is directly related to the study's broader interest in immersive installations and multimodal awareness.

3.4 Data Analysis

The responses collected were analysed using descriptive statistical analysis. The proportion of answers within each Likert-scale category was then computed to determine the general pattern of participant replies.

3.5 Methodological Importance

The method is based on factual participant responses and a qualitative or art-historical case study. The survey is a substantive proof of how those surveyed see the interaction of sound and light in an installation environment. James Turrell case study is an interpretive assessment of light and environment and experience.

3.6 Case Study: James Turrell

James Turrell elevates the fundamental elements of human existence—light and space—into his chosen artistic medium, making perception itself the core of his practice.

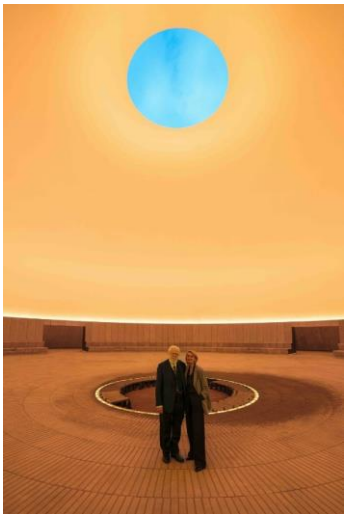

Figure 1: As Seen Below: The Dome, a Skyspace by James Turrell. Photo by Mads Smidstrup © ARoS, 2025. From James Turrell's visit to As Seen Below in June 2025.

Light as Material: Turrell uses light as his primary "material" and then manipulates the variations in lighting such that the observer re-reads what they perceive in the architecture and even the natural sky. It appears that he is referring to art as an act of looking rather than a fixed object that sits steady and unchanged. The entire exhibit encourages viewers to observe subtle variances in light, hue, and sky. As a result, it fosters a peaceful dialogue between the created area and the surrounding living environment. Also, to one author [20], Turrell's method questions the traditional use of light as an illumination technique. Instead, he encourages viewers to focus on the sensation

of seeing as opposed to a well-defined object by placing light itself as the main subject of perception. With this method, the observer is moved from impartial observation to reflection and awe. This knowledge is especially pertinent to Lifting the Veil, as light is employed to change the viewer's perception of colour, depth of field, and overall space in addition to illuminating the Glassworks.

Sensory and Perceptual Experience: Rather than simply seeing, you nearly engage in it. There is also a psychological, experiential absorption that occurs as a result of the confined space. The progressive shifts in light make you more introspective, and your senses feel heightened.

Even the underground path, or in-between part, serves as a mental warm-up, a design to prepare you before you really get in the event. Lastly, Turrell's art foregrounds a deeply personal perception rather than a sealed off visual image. According to a hybrid assessment [21] of Turrell's As Seen Below: In the Dome, light was an atmospheric element that contributed to participants' perception, orientation in space, and physical experience, in addition to serving as lighting. In addition, a combination of relaxation and activity was noted in the research, suggesting that the experience of light may create complex perceptions and mental states. These results provide credence to the idea that Turrell's light scapes affect the viewer's perception of space both physically and mentally, engaging them beyond simple visual observation. According to the survey results as seen below, 98.4% of participants believed that music and light combined to create a mixed sensory experience.

Introduction: The artwork below is part of James Turrell's recent "Lighting the Veil" exhibition in Gagosian, located in Hong Kong. In this case, light is also a substance or medium, as it serves as the primary medium for the construction of viewers' perception. It illustrates how experiential learning may have a direct impact on the viewers' relationship with one another.

Light, Color, and Perception: The frame shown in the image above is a piece of art by James Turrell called Glassworks, which is computer-controlled LED lighting that changes colour over time. and the audience' visual perception is created by the colour flow between the work's core and borders. It allows visitors to observe rather than merely being a permanent composition hanging on the wall. Since the viewer's experience is not limited to a single movement, this temporal artwork feature is essential to comprehending immersive art.

Light and Space Transformation: Glassworks transform the adjacent rooms as we discuss them in further detail. Eventually, the lines between the pieces of art became less distinct. that cause viewers to experience the changing environment in addition to the item and frame. This light-space interaction is relevant to the study's goal of changing viewers' perceptions of immersion.

Depth, Flatness, and Perceptual Ambiguity: The flatness and depth are changing according to the glasswork and the light from the same. As a result, the encounter is an active method of interpreting visuals in which the observer constantly adapts to shifting perceptual circumstances. The viewer's traditional perception of the connection between exterior, space, & dimension is called into question by these changes. According

to [22], research looks at Turrell's work in light of the concept of a "no-point-of-view" experience, in which traditional divisions between the spectator and their surroundings as well as between inside and outside become less clear. One example of a setting that might make viewers especially conscious of their own act of seeing is the Ganzfeld Sphere. The study also suggests that these types of perceptual circumstances may enhance awareness of the link between subjective perception and somatic sensation, building on the work of Antonio Damasio and others.

Figure 2: Installation View of James Turrell Works, Mixed Media with LED Panel, From Lifting the Veil, Hong Kong

3.7 Quantitative Analysis: Questionnaire

The poll findings suggest considerable support for multimodal integration in installation art. Most people are in on it. 91.3% agreed, and 7.1% strongly agreed, which is a large number. Only approximately 1.6% remained neutral, and none picked Disagree or Strongly Disagree. So, 98.4% of respondents agreed that light and music assist in building a composite sensory experience.

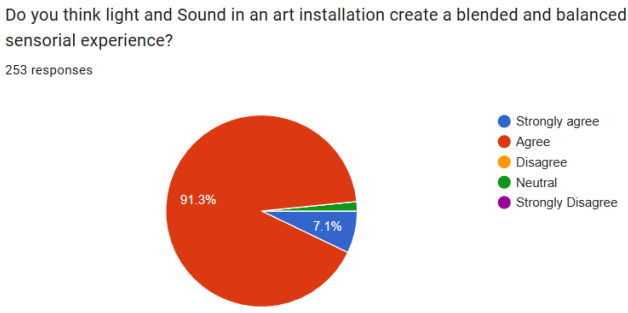

Figure 3: Questionnaire Findings

Every aspect of the results presented shows a great respect for the synergy that exists between hearing and seeing, especially in creative situations. That almost overwhelming positive response suggests that when artists carefully integrate these features, it tends to enhance the viewer's sense of them, so the whole area feels more complete and richer. The small neutral element and the complete absence of disagreement strengthen the idea that this type of integration is widely regarded as an effective technique for increasing artistic participation.

The quantitative information offers an unambiguous baseline for audience experience, supplementing qualitative studies, such as the Turrell case study, which examine the unique immersive potential of light and spatial form. Combining these approaches offers an in-depth picture of the influence of sensory modalities on the overall impact of modern artwork.

4 Results and Discussion

4.1 Questionnaire Findings as a Viewer's Perception of Multisensory Installation Art

The questionnaire's empirical findings confirm the critical role that multisensory integration plays in contemporary installation art. The great majority of the 253 respondents—91.3% agreed, and another 7.1% strongly agreed—said that the combination of light and music promotes a balanced, integrated sensory experience. As a consequence, the total reaction was 98.4%, which was quite favourable. The overwhelmingly favourable reaction indicates that participants believe the combination of music and light makes for a more comprehensive and captivating sensory experience. Light and music may influence how viewers observe and interact with the creative environment rather than serving only as formal or compositional components. Thus, the results offer empirical evidence in favour of investigating multimodal installation art as a medium that might impact emotional and sensory involvement. These findings should be regarded with caution, too, as the questionnaire only captures participant impressions rather than proving a clear causal link between psychological immersion and sensory integration. Furthermore, the total experience may be greatly influenced by the deliberate use of a certain sensory medium in a spatial setting. The use of light in James Turrell's work illustrates how illumination may change perceptual experience and architectural space.

4.2 Connection with Multisensory Experience and Turrell's Light Artwork

Multisensory awareness is approached from two related angles in the Lifting the Veil study and the questionnaire. With 98.4% of those involved either concurring with or completely concurring that sound and light may generate a blended and balanced sensorial experience, the questionnaire offers the answers that participants had a very favourable opinion of how light and sound work together to create a mixed sensory

experience. Turrell's Lifting the Veil, on the other hand, shows how light, colour, duration, and space manipulation may be the main means of creating immersive perceptual circumstances. According to the two viewpoints, immersion can be attained in two ways: either by integrating various sensory modalities, as the survey suggests, or by drastically altering perception in a spatial setting, as Turrell's method of practice demonstrates. As a result, adding more than one sensory stimulus is not the only way to conceptualise multimodal absorption. Instead, it could also result from the organisation, intensification, and integration of sensory data with perceptual and spatiotemporal contexts.

5 Conclusion

By encouraging an embodied, active interaction with light, sound, space, and perception, this study shows how modern multimodal installation art extends the aesthetic experience beyond simple object observation. Results of an empirical survey. James Turrell's case study serves as an example of how light, spatial design, and perceptual ambiguity elevate the act of perception to the centre of a viewing environment. This research illustrates how modern installation works may expand the aesthetic experience beyond traditional visual observation by studying viewers' views of sound as well as light in conjunction with James Turrell's light-based approach. While Lifting the Veil demonstrates how light, coloration, space, and perceptual ambiguity may influence the audience's perception, the questionnaire results should not be interpreted as definitive evidence of multisensory or psychological immersion, but rather as descriptive evidence of participant impressions.[23] The connection between installation art and architecture emphasises how crucial space is in forming creative and perceptual experiences. James Turrell's artworks are presentations of the artwork that turn architectural space into a place that gives a novel perception of the artwork. This viewpoint demonstrates the significance of perception in enhancing immersive experiences.

5.1 Limitations of the Study

The results give an idea of participants' impressions rather than a thorough assessment of multisensory or psychological immersion because the questionnaire only included one item and the analysis was restricted to descriptive percentages.

5.2 Future Recommendations

Bigger Sample: To provide precise information, it is recommended that future research involve more participants from various age groups.
Direct installation-based Study: We may investigate viewers' own experiences with the specific artwork rather than only relying on questionnaire replies.
Comparison of Sensory Modes: To comprehend various sensorial modalities, future studies can take into account both light-based and sound-based environments to understand how each can provide distinct experiences.

More thorough Psychological Measurements: Future studies can confirm the many metrics about presence, psychological immersion, emotional responses, and attentiveness.
Using more sophisticated Technology: Previous research was limited to light situations, but with the aid of VR and AR, this experience can provide more unique experiences.

Acknowledgement. I want to express my gratitude to the professors, classmates, and coworkers who helped with this study and offered advice on how to make the conceptual and analytical sections better. I would also want to express my gratitude to everyone who helped to finish this study through encouragement, insightful remarks, and serious discussions.
Disclosure of interest. Regarding the subject matter of this study, the author attests that there are no conflicting interests.
