Comparison between MRI aPWV (mean: 4.78±1.41 m/s) values and cpPWV (mean: 7.76±0.90 m/s) values showed a good correlation ($R^2=0.73$). MRI cpPWV (mean 1.99±0.74 m/s) values were positively correlated ($R^2=0.90$) with CS (mean: 4.88±0.86 m/s) values and showed a lower correlation with cpPWV ones ($R^2=0.14$).

In conclusion, this preliminary study shows a multi-technique approach for regional and local PWV calculation aimed to realize a reference database that could be used when developing and validating new algorithms and techniques for PWV evaluation.

P2.22 ASSESSMENT OF CAROTID PULSE WAVE VELOCITY CHANGES OVER CARDIAC CYCLE: AN ACCELEROMETRIC APPROACH

Great attention has been placed on the role of carotid elasticity in cardiovascular risk evaluation. Since carotid pulse wave velocity (cpPWV) value changes over cardiac cycle, non-invasive cpPWV measurements at different cardiac cycle moments could be helpful for a full characterization of vascular behaviour. Aim of this study is to test a new accelerometric system for cpPWV assessment able to estimate three different cpPWV values. Moreover, preliminary results regarding their comparison with ultrasound carotid stiffness (CS) evaluation are presented.

Twelve healthy subjects (33.4±7.2 years, 50% males, BMI 22.7±3.5 kg/m²) have been recruited. CS values were obtained from ultrasound B-mode images analysed by contour tracking techniques together with tonometric local pulse pressure estimation and Bramwell-Hill equation. A small device, with two percutaneous accelerometers (distance: 2.4 cm) placed on a soft bracket allowed to vibrate freely, was put on the neck of each subject. Temporal shifts between the two accelerometric signals were assessed on beat-to-beat temporal basis with correlation techniques. These temporal values allowed cpPWV assessment for the whole cycle (all(cPWV), diastolic (dpPWV) and dicrotic notch (dn(cPWV)) phase. Accelerometric all(cPWV) (3.81±0.70 m/s) values showed a good correlation with CS measurements ($r=0.41$) while dp(cPWV) (3.26±1.07 m/s) and dn(cPWV) (3.74±0.59 m/s) where less correlated with them ($r=-0.17$ and $r=0.04$ respectively). As we could expect dp(cPWV) values were smaller than dn(cPWV) ones.

In conclusion, the proposed system is easy-to-use and it could be useful for the evaluation of CPWV values characterizing the entire cardiac cycle, as well as diastolic and dicrotic notch phases.

P2.23 NONLINEAR ARTERIAL PROPERTIES: PRESSURE-INDEPENDENT CHARACTERIZATION

The pressure-volume relationship in real arteries is nonlinear. As a result, stiffness is pressure-dependent. Hereby, I propose a model-based pressure-independent and measurable characterization for such arteries. Literature shows that under normal conditions arterial pressure $P$, as measured in vitro or in vivo at the systolic pressure ($S$) and diastolic pressure ($D$), increases exponentially with the absolute or relative arterial volume $V$, lumen area or cross section ($A$). This finding is independent and measurable characterization for such arteries. Literature

Background: Different methods and several devices exist for measuring cardiac output by minimal invasive techniques, all based on arterial pulse contour analysis (FloTrac™/Vigileo™, Edwards Lifesciences; PICCO™, Pulsion Medical Systems; LiDCO™/PulseCO®, LiDCO Ltd; PRAM/MoToCare, FiAB SpA; Modelflow™, Finapres Medical Systems). However, their measurement accuracy, especially during changing patient conditions, remains under discussion. The underlying CO measurement methods and their limitations will be presented in detail and the results of recent comparative studies between these devices and the "gold standard", pulmonary artery catheter thermocatheter (PAC TD), will be discussed.

Methods: Prospective studies and available reviews on the comparison of the pulse contour approach with the established PAC TD technique were included in our meta-analysis. As far as available, the relevant results (data for the range of cardiac output, bias, percentage error) and the software versions used were included.

Results: Studies comparing the available systems for CO measurement have been performed in a variety of clinical settings. For instance, out of 53 analysed studies of CO determination by arterial pulse contour analysis, the majority shows acceptable accuracy during stable hemodynamic conditions. However, the studies under varying hemodynamic situations (systolic dysfunction, loss of fluids etc.) demonstrate insufficient accuracy (with percentage errors exceeding the 30% limit as suggested by Critchley & Critchley). Under stable hemodynamic conditions CO measurements based on intermittent bolus TD and arterial pulse contour analysis seem to yield comparable Results: Further improvement and validation studies are needed to prove the reliability of CO determination in unstable patients with the systems presently available.

P2.25 THE EFFECT OF MUSCULARITY AND HANDEDNESS ON RADIAL ARTERIAL PULSE WAVE VELOCITY IN HEALTHY VOLUNTEERS

A. Kumar, P. S. T. Ray, D. Morisse, R. Twycross-Lewis, S. E. Greenwald

Introduction. Despite current interest in conduit artery stiffness, no in vivo studies have reported its relationship to surrounding muscle and the possible effects of tethering. We investigated the effect of musculature and handedness on radial artery pulse wave velocity (rapPWV) in each arm to test three hypotheses. Is there: 1) a difference in raPWV between the dominant and non-dominant arm? 2) an association between arm muscularity and raPWV? and 3) a difference in raPWV between left and right handers?

Methods: Handedness was assessed by questionnaire and examination of signatures in 54 healthy volunteers (18-60y; 22 left-handed, male/female 12/10; 32 right-handed, male/female 17/15). Muscularity was defined by arm circumference measurements. rapPWV was measured between the distal end of the brachial artery (8MHz Huntleigh Doppler) and the tip of the ring finger (Nelcor clip-on pulse-oximetry sensor). Data were sampled for 30s at 1kHz and analysed off-line.

Results: 1) There was no significant difference between dominant and non-dominant rapPWV (paired t-test) and no sex differences in either arm. 2)
