ejection time (298.9 ± 4.9ms vs. 316.8 ± 4.5ms) (t-test, p < 0.05). In addition, the normotensives with a family history of hypertension have decreased latency of the baroreflex response (7.0 ± 0.5 s) compared to the control group (10.5 ± 0.9 s) (p < 0.001).

Conclusions: Our results indicate that even normotensives with a family history of hypertension exhibit changes of some cardiovascular parameters at early age. The changes in Valsalva manoeuvre response also show alteration of the autonomic nervous system reactivity.

P4.28 IMPACT OF WEIGHT CHANGE ON INTIMA MEDIA THICKNESS OF CAROTID ARTERIES AND ENDOTHELIAL FUNCTION IN GEORGIAN OBESITE AND OVERWEIGHT HYPERTENSIVE SUBJECTS

K. R. Chagunava, G. V. Lomtatidze
National Centre of Therapy, Tbilisi, Georgia

Objectives: Taking into consideration that obesity and AH are the most important related risk-factors of CVD we examined differences in carotid artery intima-media thickness (IMT) and endothelial function between obese and overweight hypertensive individuals.

Methods: We studied 102 patients with mild to moderate AH (67males/35females, mean age 51,3±2,4years, BMI 30,9±1,9kg/m², duration of AH 4,6±1,4years). Examination included: color triplex carotid artery scanning; assessment of endothelial function of brachial artery; 24-hour BP monitoring. 49 overweight patients (25-BMI<29,9kg/m²) were assigned to group 1 and 53 obese patients (BMI>30kg/m²) to group 2.

Results: The groups were comparable by the age, duration of AH, daily mean BP values. Mean values of IMT (gr1:1,02±0,03mm,gr2:1,08±0,04mm) were certainly increased in obese patients compared with overweight ones (p<0,001). Prevalence of carotid atherosclerosis was higher in gr2 (79%vs67%). Endothelium - dependent vasodilatation (EDV) (gr1:7,5±0,5,gr2:7,01±0,3%) was significantly reduced in obese patients (p<0,01), but occurrence of endothelial dysfunction was almost equal (gr1:59;gr2:60%). BMI positively correlated with IMT (r=0,25,-p<0,02) and negatively with EDV (r=-0,4,-p<0,05).

Conclusions: Thus, in obese hypertensive subjects we detected more pronounced and frequent carotid artery affection and endothelial dysfunction comparing with overweight ones. Data of our study demonstrate importance more profound examination of cardiovascular system in obese hypertensive patients with subsequent more aggressive blood pressure and weight reduction.

P4.29 LEFT ATRIAL REMODELLING IS AN EARLY CARDIAC STRUCTURAL CHANGE IN HYPERTENSION

B. C. Cieciernyszna 1, J. J. Jaroch 1, E. K. Kruszyńska 1, Z. B. Bocigia 1, M. L. R. Loboz-Rudnicka 1, W. R. Rychard 1, J. P. Polanski 4, K. D. Dudek 3, S. S. Daskalopoulou 1

Background: The interest in left atrial remodelling (LAR) as a TOD in hypertension (H) has been growing recently. Little is known on the role of arterial stiffness (a.s.) in the pathophysiology of LAR in H. We hypothesized that LAR precedes LVH and diastolic dysfunction (d.d.) in H and is associated with carotid a.s., independently of other possible confounders.

Methods: 85 patients—45 with H31male and 34female,mean age55.9±10.7 years and 20 control matched subjects(C). From echocardiography: left atrial volume normalized to BSA (LA vol/BSA,ellipsoid method), LVM, RWT, IVS, PW; from conventional and Tissue Doppler: early(E), late(a) mitral flow velocities, E'/a' ratio,early(e')/late(a) mitral diastolic annular velocities, e'/a' ratio;E/e'ratio were calculated. From carotid arteries ultrasound—IMT and high-resolution echo-tracking method a.s. parameters were evaluated: [stiffness index, Ep-elastic modulus, AC-arterial compliance, PWVI-one-point pulse wave velocity. Results: LAVol/BSA was the highest in H with LHV(24,9ml/m²,1) and in H with d.d.(23,5ml/m²). However,already in H without LVH,LA vol/BSA was significantly higher than in C (21,1ml/m²,9.136.8ml/m²,8;p<0,05) and also in H without d.d. LA vol/BSA was significantly higher than in C (20,5ml/m²,5.5vs18,3ml/m²,4,8;p<0,048). Linear regression analysis revealed the following significant correlations between LA vol/BSA and age(r=0,3), BMI(r=-0,38), mean BP(r=0,25), preload(r=0,27), afterload(r=0,24), LVM(r=0,59), RWT(r=0,23), IVS(r=0,5), PWR(r=0,42), e'(r=-0,3), E/e'(r=0,46), BNP(r=0,73), Ep(r=0,25) and PWVI(r=0,25);p for all <0,05). However in multiple regression analysis the independent determinants were: age,BMI,mean BP,LVM,E/e' and PWVI.

Conclusion: LAR is one of the earliest cardiac structural changes in H that precedes LVH and d.d.Local PWVI is an independent determinant of LAR beyond:BP components, LVH, d.d.indices.It supports the hypothesis on the contribution of arterial stiffness to LAR.

P4.30 ALCOHOL EXERTS A SHIFTED U-SHAPED EFFECT ON CENTRAL AND PERIPHERAL BLOOD PRESSURE IN YOUNG ADULTS

Consumption of 1-2 alcoholic beverages daily has been associated with a lower risk of cardiovascular disease and all-cause mortality in middle-aged and older adults. Recent studies suggest that central blood pressure (BP) is a better predictor of cardiovascular risk than peripheral BP. However, potential effects of habitual alcohol consumption on central BP particularly in young adults, the primary consumers of alcohol in North America, have yet to be investigated. Therefore, we aimed to study the effect of alcohol consumption on central and peripheral BP, pulse pressure amplification, and arterial stiffness specifically in young adults.

We recruited 130 healthy, non-smoking, non-obese individuals. Using a standardized questionnaire, alcohol consumption (drinks/week) was used to classify participants into none, 1-2, light (2-6), moderate (women: 7-9, men: 7-14), and heavy drinkers (women: >9, men: >14). Central BP and arterial stiffness measurements were obtained using applanation tonometry. We found a U-shaped effect of alcohol consumption on both central and peripheral BP.

Light drinkers had significantly lower central and peripheral systolic, and mean arterial BPs when compared to non- and moderate drinkers (P<0.05). No significant associations with arterial stiffness parameters were noted. A U-shaped relationship was found between alcohol consumption and both central and peripheral BP in young individuals, which importantly, was shifted towards lower levels of alcohol consumption than currently suggested. This is the first study, to our knowledge, that examines the effect of alcohol consumption on central BP and arterial stiffness exclusively in young individuals. Prospective studies are needed to confirm the relationships observed herein.

P4.31 ALTERED THROMBIN GENERATION IN SUBJECTS WITH FAMILIAL HYPERCHOLESTEROLEMIA

2Karolinska Institutet, Department of Clinical Sciences, Danderyd Hospital, Division of Medicine, Stockholm, Sweden
3Karolinska Institutet, Department of Medicine, Karolinska University Hospital, Huddinge, Stockholm, Sweden

Purpose: The effects of angiotensin II (ANG) on inflammation and haemostasis were examined in 16 otherwise healthy patients with familial hypercholesterolemia (FH) and in 16 healthy controls.

Methods: Plasma markers of inflammation (CRP, IL-6, fibrinogen, leukocyte counts [LCT], coagulation (thrombin generation: F1+2, Calibrated Automated Thrombogram [CAT], fibrinolysis (plasmin-antiplasmin complexes, PAI-1 activity) were assessed in conjunction to iv ANG infusion (10 ng/kg/min for 3 h). Means ± SD; repeated measures ANOVA, log transformation when appropriate.

Results: Baseline systolic blood pressure was higher in FH than in controls (127±14 vs 115±12 mm Hg, p<0.05), while responses to ANG were similar (+24±10 and +21±7 mm Hg). Baseline hs-CRP, IL-6, LCT, and fibrinogen were similar in FH and controls, and all increased similarly in both groups (p<0.05) during ANG. Baseline CAT (peak and ETP) was higher in FH (367±47 vs 317±60 nM, p=0.01, and 2148±391 vs 2042±358 nM/min, p<0.01, respectively), but ANG did not affect CAT (peak or ETP). Baseline PAI-1 activity was similar in FH and controls (96±16 vs 93±27 µg/L) and increased (p<0.001) similarly by ANG in both groups. PAI-1 activity was similar in both groups at baseline (1.3±1.3 vs 1.1±1.2 ng/L) and decreased (p<0.001) similarly in both groups, confirming the diurnal variation in fibrinolysis.

HAEMODYNAMIC PATTERN OF OBESE PATIENTS ON PRIMARY CARDIOVASCULAR PREVENTION

Hospital Universtario Austral, Pilar Buenos Aires, Argentina

Background: Impedance Cardiography (ICG) is a non-invasive method to assess the main haemodynamic parameters: cardiac output, peripheral resistance, cardiac work, and thoracic fluid content. There is no agreement about the haemodynamic pattern in obese patients and it is very important at the time to decide adequate therapeutic interventions.

Objective: To study the haemodynamic pattern in obese patients

Methods: We compared 95 male obese patients with 212 matched male lean controls between DEC2010 and JAN2011 derived for routine cardiovascular evaluation without history of CV disease, for Primary CV Prevention. We used an Impedance Cardiograph (Z Logic (R)) following standard procedures.

Results: (only signif.) Obese patients presented higher BP, HR, BMI and BSA. They had increased Thoracic Fluid Content and higher Peripheral Resistance Index and reduced Aortic compliance.

Cardiac Index and cardiac acceleration index were lower and pre-ejection period was longer in the obese group.(see table attached)

Conclusion: Obese patients matched with controlled parameters present increased thoracic fluid content, peripheral vascular resistance and aortic stiffness associated with depression of cardiac function. This pattern may be associated to early stages of ventriculo arterial uncoupling and increased CV risk.

ASSOCIATION BETWEEN DEPRESSION, ANXIETY AND INFLAMMATION PROCESS IN POSTOPERATIVE PERIODS OF CORONARY ANGIOPLASTY AND AORTO-CORONARY BYPASS GRAFT SURGERY

T. Gegenava, M. Gegenava, G. Kavtaradze
Tbilisi State Medical University, Tbilisi, Georgia

Purpose: Depression and anxiety has been related to a higher risk of developing coronary heart disease, but the mechanism that accounts for this association is unclear. The aim of our study was to investigate the association between history of depressive episode and anxiety and presence of low-grade systemic inflammation as measured by serum C-reactive protein in postoperative period of coronary angioplasty (PCA) and aorto-coronary bypass graft surgery (CABG).

Methods: The research was performed in 80 patients (n=80), mean age 60±15 years. These patients have no high cholesterol level, high body mass index and n=64 (80%) of them are no smoker. To evaluate depression we used Beck depression scale. Anxiety was assessed by the Spielberger State-trait anxiety scale. CRP was measured in venous blood.

Results: In angioplasty group patients who had increased level of CRP had high degree of depression and trait anxiety p=0.001; p<0.001. In aorto-coronary bypass graft surgery group elevated level of CRP was also associated with high degree of depression p=0.001. In PCA and CABG groups patients who were rehospitalized with signs and symptoms of heart failure (NYHA II-III) during 2 year follow up period had high and moderate degree of depression p=0.003 and anxiety p=0.001 (state anxiety p=0.001; trait anxiety p=0.001).

Conclusions: Our study demonstrated association between depression, anxiety and increased c-reactive protein level. These results may have important implications in explaining the physiopathological mechanisms linking depression and anxiety to cardiovascular disease.
