**Abstract.** The Party and the State attach great importance to the development of the big data industry, and from 2014 onwards, the development of big data was incorporated into the work deployment at the national level. Subsequently, programmatic documents for the promotion and development of big data industry as well as relevant industrial development plans have been formulated and released in the name of the State Council and national ministries, elevating big data to a national industrial development strategy. This paper aims to study the influencing factors of the development of big data industry in Guizhou Province, and to identify the factors that really affect the development of big data industry in Guizhou Province by building a model and testing the heteroskedasticity and autocorrelation of the influencing factors. The data query for the influencing factors was obtained from the public data provided by the National Bureau of Statistics. By testing the validity of the model, the factors influencing the development of the big data industry in Guizhou province are analysed and suggestions for the future development of the big data industry in Guizhou province are given based on the influencing factors.

**Keywords:** big data industry · influencing factors · empirical analysis

## 1 Introduction

The development of the big data industry, entering a new era, has received great attention from the Party and the State. At the 19th Party Congress held in 2017, clear requirements and special arrangements were made to develop the big data industry, especially to promote big data technology to empower traditional industries and the real economy, and to achieve comprehensive and deep integration of big data and other technologies with the real economy [1]. The National 13th Five-Year Plan and 14th Five-Year Plan also regard the big data industry as a strategic and leading industry for China's economic and social development in the new era, and attach great importance to the development of the big data industry as a national industrial development strategy and make relevant action deployment [2]. By reviewing the available literature and research reports on the big data industry in Guizhou, this thesis compares and analyses the relevant practices and initiatives in the development of the big data industry in Guizhou Province and other

regions, analyses and studies the relevant factors affecting the development of the big data industry in Guizhou Province, endeavors to grasp the general laws that promote the benign development of the big data industry, and through the analysis of these influencing factors and the laws of industrial development Through the analysis of these influencing factors and the grasp of the laws of industrial development, we will take them as the entry point and put forward some rationalized suggestions for the next step to enhance and develop Guizhou's big data industry, so as to promote Guizhou's big data industry to actively cope with the challenges, maintain its advantages and avoid its disadvantages, so as to achieve better and faster development in the new era and lead and drive the transformation and upgrading of Guizhou's economic and social development [3].

## 2 Building a Multiple Linear Regression Model

### 2.1 Identification of Explanatory and Explained Variables

The sample data of indicators of the model are shown in Table 1. Above, and the variables of the model are standardized by using spss, [4] and the results are shown in 1. The standard deviation of GDP is 3122.82846, the standard deviation of industrial output value of high-tech industry in Guizhou Province is 394.06663, and the standard deviation of the number of enterprises related to big data industry in Guizhou Province is 3275.49679. From the above, we can see that the standard deviation statistics between variables are still quite different, so it is necessary to standardize the selected variables. From Table 2, we can see that the kurtosis and skewness distributions of the industrial output value of Guizhou's big data industry, Guizhou's GDP and the industrial output value of Guizhou's high-tech industry are all close to zero, so we can judge that these indicators do not deviate too much from the normal distribution.

**Table 1.** Influencing Factors for the Development of Big Data Industry in Guizhou Province

| Year/Sh adow Impact Factors | Total Industrial Output Value of Big Data in Guizhou Province (in billions of dollars) | GDP of Guizhou Province (Single) (Position: \$ billion) | Industrial production of high-tech industries in Guizhou Province Value (in billions) | Big Data Industry Related Enterprises in Guizhou Province Number (in units) |

|                    | To-<br>6       |             |         |                   |

a. Predictors: (Constant), Industrial output value of high technology industries

b. Dependent Variable: Big data industrial output

## 2.2 Significance Tests

### 1) F-test of model regression coefficients.

As shown the Table 3 an ANOVA table of the factors influencing the development of big data industry in Guizhou province [5]. The data in this table shows that the mean variance of the regression is 419926.365, the remaining mean variance is 2847.322, the observed value of the F-test statistic is 147.481, and the corresponding probability P-value is 0.000, which is less than 0.05, so it is concluded that the explanatory variable, the total industrial output value of the big data industry in Guizhou province (Y), and the explanatory variable, the high-tech industry in Guizhou province industrial output value (X<sub>2</sub>) has a linear relationship.

### 2) t-test of model regression coefficients.

## 2.3 Residual Analysis of the Model

As shown the Tables 2, 3, 4, 5 and 6 the residual statistics of the linear regression model of the factors influencing the development of the big data industry in Guizhou Province. The following table shows the statistics: the minimum value of the predicted value is 69.946, the maximum value is 798.3411, the median value is 4.3185, the standard deviation is 264.55194, the number of cases is 7, and the standardised predicted value, the standard deviation of the predicted value, the adjusted residual of the predicted value, the residual values, standard residuals, etc. Table 2, 3, 4, 5 and 6 Residual statistics of the linear regression model of factors influencing the development of big data industry in Guizhou Province.

As shown the Table 7 the scatter plot of the linear regression equation of the influencing factors of the development of big data industry in Guizhou Province [6]. From the Table, it can be seen that all the scatter points are basically distributed around the

a. Dependent Variable: Big Data Gross Industrial Product

### 3 Conclusion

Through the empirical analysis in Chapter 4, it can be concluded that among the factors affecting the development of big data industry in Guizhou Province, the most important influencing factor is the level of development of high-tech industry in Guizhou Province [7]. Secondly, the development level of Guizhou province's economy and the number of enterprises related to Guizhou province's big data industry, which are the two influencing factors.

All of these factors also have a greater or lesser impact on the development of the big data industry in Guizhou Province.

Based on the above conclusions, combined with the understanding of the past development of big data in Guizhou and the practices of other regions in developing big data industry, the following recommendations are made to accelerate the development of big data industry in Guizhou Province in the next step [8].
