#### Abstract

In order to improve the surface quality of KDP crystals, the factors of process parameters on surface quality of KDP crystal was researched, the KDP crystal was machined by quadratic regression rotation optimization method and single point diamond turning technology.On-line monitoring the surface roughness and waviness of KDP crystal, using multi-factor interaction to get analysis rules.Finally, partial least squares method and lingo software were used to obtain optimal processing program, the tool radius of 9 mm ,speed of $800 \mathrm{r} / \mathrm{min}$, feed rate of $9.184 \mu \mathrm{~m} / \mathrm{r}$,turning back of $21 \mu \mathrm{~m}$. With these process parameters to machine KDP crystal ,surface waviness can be achieved $0.020 \mu \mathrm{~m}$, and surface roughnesscan be achieved $0.017 \mu \mathrm{~m}$, has important guiding significancefor machining large-size and high quality KDP crystals.

## 1 Introduction

Large diameter KDP crystal is the only optical crystal materials [1]can be used for inertial confinement fusion system of high power laser drive Pockels box. In high power laser system, the technical requirements of KDP crystal is low surface roughness and surface waviness and high precision surface shape quality [2, 3].At present ,only a very few countriessuch as the USA and Japan can process the high requirements of products, KDP crystals industrialization of our country has a great gap with developed countries. Using orthogonal experimental method and extreme difference analysis for KDP crystal machining process parameters optimization research, got the KDP crystal surface roughness value of 0.028 um, and the surface waviness a value of 0.033 um [3], in the end,the experiment was optimized by using quadratic general rotary combination method and multi-factor analysis the main factors influencing the surface quality of KDP crystal. Carried out in the process of KDP crystal SPDT cutting surface roughness and waviness of the optimization and control technology research, to raise the level of our country to satisfy the requirements of large diameter KDP crystaland has practical implications for breakingthrough the foreign technology blockade.

## 2 Organization of the Text

### 2.1. The SPDT principle method and the experimental results

KDP crystal is a good kind of the nonlinear optical crystal. SPDT is an ideal method [4]for KDP crystal machining, through fly knife to remove parts surface thin layer materials, access to nanoscale surface quality and shape accuracy, no need to polishing, can effectively improve the laser damage threshold of crystal components [5, 6].

The experiment used ultra-precision horizontal machine tool as the platform, the SPDT technology of KDP crystals for machined part cutting experiment, specimen is $180 \mathrm{~mm} * 180 \mathrm{~mm} *$ 12 mm , experimental tool for diamond circular arc, the arc radius of $5 \mathrm{~mm}, 6 \mathrm{~mm}, 7 \mathrm{~mm}, 8 \mathrm{~mm}$ and 9 mm , cutting tool rake Angle are all $0^{\circ}$, after cutting tool Angle are all $7^{\circ}$, with no chip breaker groove, processing principle is shown in figure 1.

The design of Quadratic general rotary combination, test of N is distributed in three radius of the sphere of unequal [7].As the independent experimentvariable m is the cutting tool radius of circular arc, spindle speed, feed, turning back for four factors, respectively signified $Z_{1}, Z_{2}, Z_{3}, Z_{4}$. Based on the quadratic general rotary combination design parameter table, take $\mathrm{N}=31$ [8]. When carried on the quadratic general rotary combination design, first ensure the upper and lower levels of each factor $Z_{2 j}$ and $Z_{1 j}$, and then calculate the zero $Z_{0 j}$ and change spacing $\Delta_{j}, j=1,2, \ldots, m$. Hand down the factors in the actual experiment $\mathrm{Z}_{\mathrm{m}}$ through coding formula into coding factors $\mathrm{X}_{\mathrm{m}}(\mathrm{m}=1,2,3$, 4), there will be units of natural variables $Z_{j}$ had became no unit specification $X_{j}$, draw up the factor levels coding value table, do the experiments of each set of data and test them, gathered 18 group of measurement results, is shown in table 1.

### 2.2.TheAnalysis of the influential factors of KDP crystal surface waviness

The establishment and analysis of quadratic regression mathematical model for surface waviness.Based on regression model, regression coefficients and the striation values in table 1, through the DPS data processing system, obtained the regression equation ofsurface waviness.
$\mathrm{Y}_{1}=12.3286-1.0833 \mathrm{X}_{1}-2.3667 \mathrm{X}_{2}-4.5 \mathrm{X}_{3}-0.525 \mathrm{X}_{4}-0.1405 \mathrm{X}_{1} \cdot \mathrm{X}_{1}+1.0845 \mathrm{X}_{2} \cdot \mathrm{X}_{2}+5.622 \mathrm{X}_{3} \cdot \mathrm{X}_{3}-1.003 \mathrm{X}_{4} \cdot \mathrm{X}_{4}-0.55 \mathrm{X}_{1} \cdot$ $\mathrm{X}_{2}-2.0625 \mathrm{X}_{1} \cdot \mathrm{X}_{3}-1.65 \mathrm{X}_{1} \cdot \mathrm{X}_{4}+2.3125 \mathrm{X}_{2} \cdot \mathrm{X}_{3}-0.2 \mathrm{X}_{2} \cdot \mathrm{X}_{4}-0.7875 \mathrm{X}_{3} \cdot \mathrm{X}_{4}(1)$

In the SPSS nonlinear regression analysis results, founded that $95 \%$ of confidence interval which in the regression coefficients containing no zero, showed that the estimate value of 15 parameters is statistically significant. On the basis of the results of variance analysis for inspection formula(1), to analyze its reliability. Waviness value data of variance analysis are shown in table 2.

Tab. 2 The Variance Analysis Table Based on Experiment Results Waviness

|  | Sum of <br> Squares | Degrees of <br> Freedom | Mean <br> Square | Partial <br> Correlation | Value of p |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Linear <br> Regression | 1869.8192 | 14 | 133.5585 | $\mathrm{~F}_{2}=5.43540$ | 0.0014 |
| Surplus | 393.1518 | 16 | 24.5720 |  |  |
| Variable |  |  |  |  |  |
| Lack of fit | 349.1775 | 10 | 34.9178 | $\mathrm{~F}_{1}=4.76430$ | 0.0029 |
| Average <br> error | 43.9743 | 6 | 7.3290 |  |  |
| Summation | 2262.9710 | 30 |  |  |  |

Lack of fit and regression equation Test.From table 2, $\mathrm{F}_{1}>\mathrm{F}_{0.05(10,6)}=4.06, \mathrm{~F}_{2}>\mathrm{F}_{0.01(14,16)}=$ $3.7, \mathrm{~F}_{3}=18.2233>\mathrm{F}_{0.01}(14,6)=4.46$, all reached very significant level, indicating that arc radius, speed, feed,and turning back four dependent variable has significant impact on the surface waviness of KDP crystals.

According to the sum of squares regression models available in table 2establishedthe determination coefficient $\mathrm{R}^{2}=0.8263$, shown that the variable effects on surface waviness is $82.63 \%$, meaned the experimental sample points fitting effect is of good and high reliability.

Durbin-Watson Test.Itwas carried out on the regression equation,obtained DW $=2.2392$, proving surface waviness model residual error did not exist autocorrelation, obeied the normal distribution. Figure 2 is the waviness regression plot of surface waviness, the scatter did not show obvious regularity, showed that the regression equation is reliable.

Analysize the influence factors of KDP crystal surface waviness.For the surface waviness, the influence degree of order is feeding quadratic coefficient, feeding, speed, the interaction of speed and feeding, other items at the 0.1 level was not significant. Waviness in the regression equation of the interaction of the rotation and feed $\mathrm{X}_{2} \mathrm{X}_{3}$ has significant effects on the dependent variable. Using multiple factor method and MATLAB software to analyze the influence rule, as shown in figure 3. In the Figure 3, X , Y axis level expressing speed and feed value respectively, and the Z axis is surface waviness value.

The figure 3 shows that, when feeding increases, speed increases, the surface waviness larger,Speed decreases, and surface waviness smaller. When reducing feeding,speed increases, the surface waviness gets smaller, Speed decreases, and surface wavinesslarger. When the rotating speed at $660 \mathrm{r} / \mathrm{min}$ to $800 \mathrm{r} / \mathrm{min}$, and feeding in $7.4 \mathrm{um} / \mathrm{r}$ to $10.6 \mathrm{um} / \mathrm{r}$ changes, smaller values
changing of the surface waviness. By using lingo software to optimize the model, obtained arc radius as 9 mm ,speed as $633 \mathrm{r} / \mathrm{min}$,feeding $11.8 \mathrm{um} / \mathrm{r}$, turning back as 21 um .

### 2.3.The Analysis of the influential factorsof KDP crystal surface

Research on the effects through the same rough forthe surface roughnessof KDP crystal , first established a thematical model of surface roughness of quadratic regression.
$\mathrm{Y}_{2}=42.1429-5.75 \mathrm{X}_{1}-0.1667 \mathrm{X}_{2}+15.25 \mathrm{X}_{3}+0.3333 \mathrm{X}_{4}-4.8691 \mathrm{X}_{1} \cdot \mathrm{X}_{1}-2.7441 \mathrm{X}_{2} \cdot \mathrm{X}_{2}+3.256 \mathrm{X}_{3} \cdot \mathrm{X}_{3}-3.1191 \mathrm{X}_{4} \cdot \mathrm{X}_{4}-0.75$ $\mathrm{X}_{1} \cdot \mathrm{X}_{2}-6.875 \mathrm{X}_{1} \cdot \mathrm{X}_{3}-0.125 \mathrm{X}_{1} \cdot \mathrm{X}_{4}+1.125 \mathrm{X}_{2} \cdot \mathrm{X}_{3}+0.125 \mathrm{X}_{2} \cdot \mathrm{X}_{4}+0.5 \mathrm{X}_{3} \cdot \mathrm{X}_{4}$

Then tested and analyised the coefficient of regression equation and found that the interaction effect of the cutting tool arc radius and feed had big influence on surface roughness of KDP crystals. Finally, using the multi-factor analysis as shown in figure 4, it is concluded that,when the feed is larger: tool arc radius, the surface roughness value decreases,Tool arc radiusdecreases, the surface roughness valueincreases. When reducing feeding ,tool arc radius increases, the surface roughness value become larger, Tool arc radius, roughness value decreases, and the feeding and cutting tool arc radius are the most hours roughness values reach the global minimum. The interaction relationship is in large feeding, the cutting tool arc radius increases, the surface roughness value is smaller, with the decrease of feeding, cutting tool arc radius increases, the surface roughness value become larger [9].

Finally, optimizating to get the optimal parameter combination, tool arc radius as 5 mm ,the speed of $800 \mathrm{r} / \mathrm{min}$,feeding as $1 \mathrm{um} / \mathrm{r}$, turning back as 21 um .

Fig. 3 The Combined Effect of Speed and Feed Fig. 4 The Combined Effect of Tool Arc on Surface Waviness Radius and Feed on Surface Roughness
At last,partial least squares method and lingo software were used to obtain optimal processing program, the tool radius of 9 mm ; speed of $800 \mathrm{r} / \mathrm{min}$; feed rate of $9.184 \mu \mathrm{~m} / \mathrm{r}$; turning back of $21 \mu \mathrm{~m}$. With these process parameters to machine KDP crystal, make a series of process test,surface waviness can be achieved $0.020 \mu \mathrm{~m}$, and surface roughness can be achieved $0.017 \mu \mathrm{~m}$.

## 3 Summary

(1) Through the regression equation fitting test, significant loss inspection, determination coefficient R2, Durbin -Watson statistics test,significance test of regression coefficients,found surface waviness and roughness of the quadratic regression model Y1 and Y2 is reliable.
(2) Using factors analysis method acquired when the rotating speedwithin the range of $660 \sim 800$ $\mathrm{r} / \mathrm{min}$, feeding between $7.4 \sim 10.6 \mathrm{um} / \mathrm{r}$ changes, the surface waviness is in smaller values. When feeding increases, tool arc radius increases, the surface roughness value decreases, with the decrease of feeding, cutting tool arc radius increases, the surface roughness value become large.
(3) Draw a conclusion by nonlinear method and lingo software optimize method,when the cutting tool radius of circular arc as 9 mm , the speed as $633 \mathrm{r} / \mathrm{min}$,feeding as $11.8 \mathrm{um} / \mathrm{r}$,turning back as 21 um , surface waviness value reach the minimum. When the cutting tool radius of circular arc as 5 mm , the speed as $800 \mathrm{r} / \mathrm{min}$, feeding as $1 \mathrm{um} / \mathrm{r}$; turning back to 21 um , surface roughness valuereach
the minimum.
