Abstract—In view of the green manufacturing and remanufacturing product disassembly planning problem, one disassembly sequence planning method based on mixed graphs model of single entry specific target set is put forward, all possible disassembly sequences are generated through the construction of specific target disassembly album mixed graphs, using ant colony algorithm for disassembly mixed graphs, evaluating comprehensive cost through the heuristic information. The feasibility of the model and algorithm is verified through specific product disassembly example.

Keywords—directional disassembly; mixed graphs; ant colony algorithm; sequence planning

I. INTRODUCTION

Modern manufacturing is no longer only based on direct manufacturing efficiency and manufacturing cost competition, more constraint of limited resources and environmental constraints should be considered, so green manufacturing and remanufacturing gradually become the mainstream of the development of modern manufacturing industry as a kind of comprehensive consideration of environmental impact and resource efficiency of advanced manufacturing mod. However, how to disassemble efficiently, orderly, contrapuntally, recycling and reusing the effective implication resources become one of the key problems to be solved in the modern manufacturing industry development as a kind of advanced manufacturing mode, facing the old products with the variety, complex structure, the different requirement.

To solve this problem, many scholars have made a lot of research such as in [1] propose a method of disassembly sequence generation based on modularization, build a modular product disassembly model, automatically generate the level network graph of products, and analyzed precedence constraints according to the hierarchy network graph, in [2] plan part motion based on the rapidly random expansion tree algorithm of adaptive dynamic multi tree, in [3] describes the concept of disassembly feasibility information graph, transforming the problem of disassembly sequence planning into the optimization problem with weighted and optimum path search to the graph, and then plan the disassembly sequence of product, reference [4] put forward one method of combining disassembly mixed graphs and particle swarm algorithm, realizing the fast solution of complex product object selective disassembly sequence optimization, in [5] search for optimal or closely optimal single object selective disassembly sequence based on mixed graphs model and particle swarm algorithm,

regarding its individual parts a the goal. The above research confine to the overall steps of the disassembly according to disassembly optimal judgment, they resolve the complete deconstruction and disassemble of the products without directional selectivity.

In fact, the goal of products disassembly involved green manufacturing and remanufacturing are implemented mainly by recovery of a specific part. Therefore, this paper puts forward one method starting from the single entry and disassembling products in particular multiple target parts through the improved ant colony algorithm, which is based on mixed graph model, regards product disassembly cost and time comprehensive cost as the standard.

II. PRODUCT DISASSEMBLY MIXED GRAPH MODE

The product disassembly mixed graph[6] model in this paper is projected into the directed diagram and no directed graph set by product structure model, which is composed of directed edges, no directed edge and vertex. The three parts respectively carry three kinds of information related to disassembly. Vertices are defined by parts of disassembly product and sub assemblies, directed edges limit disassembly sequence between the different components and sub assembly, undirected edges represent relationship between all the parts and assembly. The assembly of mouse is as shown in Figure I, which can be projected into the mixed graphs as shown in Figure II.

FIGURE I. ASSEMBLY DRAWING

Figure II the vertex V_0 is shell, vertex V_1 is operating knob, vertex V_2 is retractor, vertex V_3 is spring, vertex V_4 is moving spring reed, vertex V_5 is normally closed contact; vertex V_6 is the normally open contact.

Disassembly mixed graph is shown as $P=\{V,UE,DE\}$, where p is product to be disassembled, UE is no directional edge collection, on behalf of associated constraints between two parts or sub assemblies. DE is directional edge collection,

on behalf of disassembly sequence between parts or sub assemblies, for example, the arrow between vertex V_0 and V_2 in Figure II means part 0 should be disassembled before part 2, while the mixed graph can be represented by two adjacency matrices.

FIGURE II. DISASSEMBLY MIXED GRAPH MODEL OF PRODUCTS

$$UE = \{ue_{i,j}\} = \begin{bmatrix} ue_{1,1} & ue_{1,2} & ue_{1,3} & \dots & ue_{1,n} \\ ue_{2,1} & ue_{2,2} & ue_{2,3} & \dots & ue_{2,n} \\ ue_{3,1} & ue_{3,2} & ue_{3,3} & \dots & ue_{3,n} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ ue_{n,1} & ue_{n,2} & ue_{n,3} & \dots & ue_{n,n} \end{bmatrix} \quad (1)$$

where:

$$ue_{i,j} = \begin{cases} 1 & \text{part } i \text{ is connected to part } j \\ 0 & \text{part } i \text{ is not connected to part } j \end{cases}$$

when $i = j$, $ue_{i,j} = 0$

$$DE = \{de_{i,j}\} = \begin{bmatrix} de_{1,1} & de_{1,2} & de_{1,3} & \dots & de_{1,n} \\ de_{2,1} & de_{2,2} & de_{2,3} & \dots & de_{2,n} \\ de_{3,1} & de_{3,2} & de_{3,3} & \dots & de_{3,n} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ de_{n,1} & de_{n,2} & de_{n,3} & \dots & de_{n,n} \end{bmatrix} \quad (2)$$

where:

$$de_{i,j} = \begin{cases} 1 & \text{part } j \text{ must be disassembled before part } i \text{ is} \\ 0 & \text{part } j \text{ is irrelevant with disassembly sequence of part } i \end{cases}$$

when $i = j$, $de_{i,j} = 0$

The two adjacency matrix [7] for the disassembly mixed graph model is obtained by formula (1) and formula (2), it is shown as Figure II.

$$UE = \{ue_{i,j}\} = \begin{bmatrix} 0 & 1 & 1 & 0 & 0 & 1 & 1 \\ 1 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix} \quad (3)$$

$$DE = \{de_{i,j}\} = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix} \quad (4)$$

III. DIRECTIONAL DISASSEMBLY SEQUENCE PLANNING BASED ON ANT COLONY ALGORITHM FOR SINGLE INLET AND MULTI-TARGET PARTS

Selection probability of ants in ant colony algorithm is decided by the pheromone concentration and the heuristic information [8], and the heuristic information of traditional disassembly method is usually decided by disassembly step number or disassembly difficulty. One effective heuristic information decision method is presented, namely, multiple target parts of product are disposable disassembled, starting from single entry and considering disassembly cost (Mechanical, labor costs) and disassembly time.

A. Heuristic Information and Probability Criterion

M is ant population in ant colony, P is disassembly goals set, $D_i(k)$ is goals collection which has been disassembled for ant k in point i , $A_i(k)$ is goals collection which can be disassembled. The information prime concentration from point i to point j is $\tau(i,j)$, its heuristic information is $\eta(i,j)$, α , β respectively indicated the weight of information concentration and the heuristic information.

Heuristic information $\eta(i,j)$ is calculated by disassembly cost price(i,j) and disassembly time(i,j), namely, $\eta(i,j) = [m \times \text{price}(i,j) + n \times \text{time}(i,j)]^{-\gamma}$, where m is disassembly cost weight, n is disassembly time weight, $\gamma > 0$, γ is a constant, price(i,j) is positively related to disassembly cost, time(i,j) positively related to disassembly time, choice probability $P_k(i,j)$ of ant k based on the above conditions is shown as:

$$P_k(i,j) = \begin{cases} \frac{\tau(i,j)^\alpha \times \eta(i,j)^\beta}{\sum_{\mu \in A_i(k)} \tau(i,\mu)^\alpha \times \eta(i,\mu)^\beta}, & j \in A_i(k) \\ 0, & j \notin A_i(k) \end{cases} \quad (5)$$

B. Construction of Disassembly Target Set and Update of Pheromone

Disassembly goals set $A_i(k)$ is accessible vertex collection for the ant k located at point i . The set can be judged by the following steps after the adjacency matrix of the parts in the mixed graph is analyzed:

- 1) Updating mixed graph, make $\sum_{t=0}^{t=N-1} ue_{i,t} = 0$ and $\sum_{t=0}^{t=N-1} de_{i,t} = 0$, namely vertex i is isolated.
- 2) If there is a point j to meet; traversal of all,

$$\sum_{t=0}^{t=N-1} ue_{j,t} \geq 1 \text{ and } \sum_{t=0}^{t=N-1} de_{j,t} = 0 \text{ (there are parts}$$

connected with j and without sequence constraints)in all vertices, j is put into $A_i(k)$.

After ant k pass by $i \rightarrow j$, the local update of the pheromone is shown by the following formula:

$$\tau(i, j) = (1 - \rho) \times \tau(i, j) + \rho \times \Delta\tau(i, j) \quad (6)$$

where, $0 < \rho < 1$, ρ is constant and it is the attenuation coefficient of pheromone;

$\Delta\tau(i, j)$ is pheromone increment that ant k pass by the path $i \rightarrow j$.

$$\Delta\tau(i, j) = \frac{C}{\eta(i, j)}, \text{ C is constant, } \eta(i, j) \text{ is the normal}$$

correlation cost function with disassembly cost price(i, j) and disassembly time(i, j), namely, it is another quantitative characterization to choose the excellent path degree as the heuristic information.

After ants pass by all graphs, the global update of pheromone on each path can be expressed by the following formula:

$$\tau(i, j) = (1 - \rho) \times \tau(i, j) + \rho \times \sum_{k=1}^m \Delta\tau_k(i, j) \quad (7)$$

Where, ρ is the same with the attenuation coefficient of partial update; m is the number of ant colony involved in of optimization path;

$\Delta\tau_k(i, j) = \frac{C}{\eta(i, j)}$ is the pheromone increment that the ant k pass by the path $i \rightarrow j$.

C. Building Child Mixed Graph And Solving Mixed Graph for the Specific Objective Collection

When multiple target parts are disassembled directionally in the single entrance, some vertex including disassembly object is built as child mixed graph according to the disassembly target set, and the product mixed graph is solved on this basis.

Step 1: establishing the child mixed graph.

Requirements: if vertex v collection $\{k_1, k_2 \dots k_n\}$ meet $i \in \{k_1, k_2 \dots k_n\} \cap j \in \{k_1, k_2 \dots k_n\}$;

While $ue_{i,j} \in UE$, $ue_{i,j}$ will be put into the new matrix UE',

While $de_{i,j} \in DE$, $de_{i,j}$ will be put into the new matrix DE',

Step 2: solving the mixed graph.

The new vertex n+1 is generated In the matrix UE, for vertex $i \in \{0 \dots n\}$,

if $\sum_{t=k_1}^{k_n} ue_{i,t} = 0$, namely, vertex i is not connected with $\{k_1, k_2 \dots k_n\}$, $ue_{i,n+1} = 0$ and $ue_{n+1,i} = 0$

if $\sum_{t=k_1}^{k_n} ue_{i,t} = 1$, namely, vertex i is connected with $\{k_1, k_2 \dots k_n\}$, $ue_{i,n+1} = 1$ and $ue_{n+1,i} = 1$.

If $i \in \{k_1, k_2 \dots k_n\} \cap j \in \{k_1, k_2 \dots k_n\}$, all points satisfying $ue_{i,j} \in UE$ is deleted.

The new vertex n+1 is generated in the matrix DE, for vertex $i \in \{0 \dots n\}$,

If $\sum_{t=k_1}^{k_n} de_{i,t} = 0$, namely, the vertex including $\{k_1, k_2 \dots k_n\}$ do not need to be disassembled before vertex i, $de_{i,n+1} = 0$.

If $\sum_{t=k_1}^{k_n} de_{t,i} = 0$, namely, vertex i do not need to be disassembled before the vertex including $\{k_1, k_2 \dots k_n\}$, $de_{n+1,i} = 0$.

If $\sum_{t=k_1}^{k_n} de_{t,i} = 1$, namely, vertex i need to be disassembled before the vertex including $\{k_1, k_2 \dots k_n\}$, $de_{n+1,i} = 0$.

If $\sum_{t=k_1}^{k_n} de_{i,t} = 1$, namely, the vertex including $\{k_1, k_2 \dots k_n\}$ need to be disassembled before vertex i, $de_{i,n+1} = 1$.

if $i \in \{k_1, k_2 \dots k_n\} \cap j \in \{k_1, k_2 \dots k_n\}$, all points satisfying $de_{i,j} \in DE$ is deleted.

D. Product Multi-Target Directional Disassembly Strategy And Ant Colony Algorithm Flow Diagram

Disassembly strategy is shown as flow diagram Figure III.

The flow diagram of ant colony disassembly algorithm is shown as Figure IV.

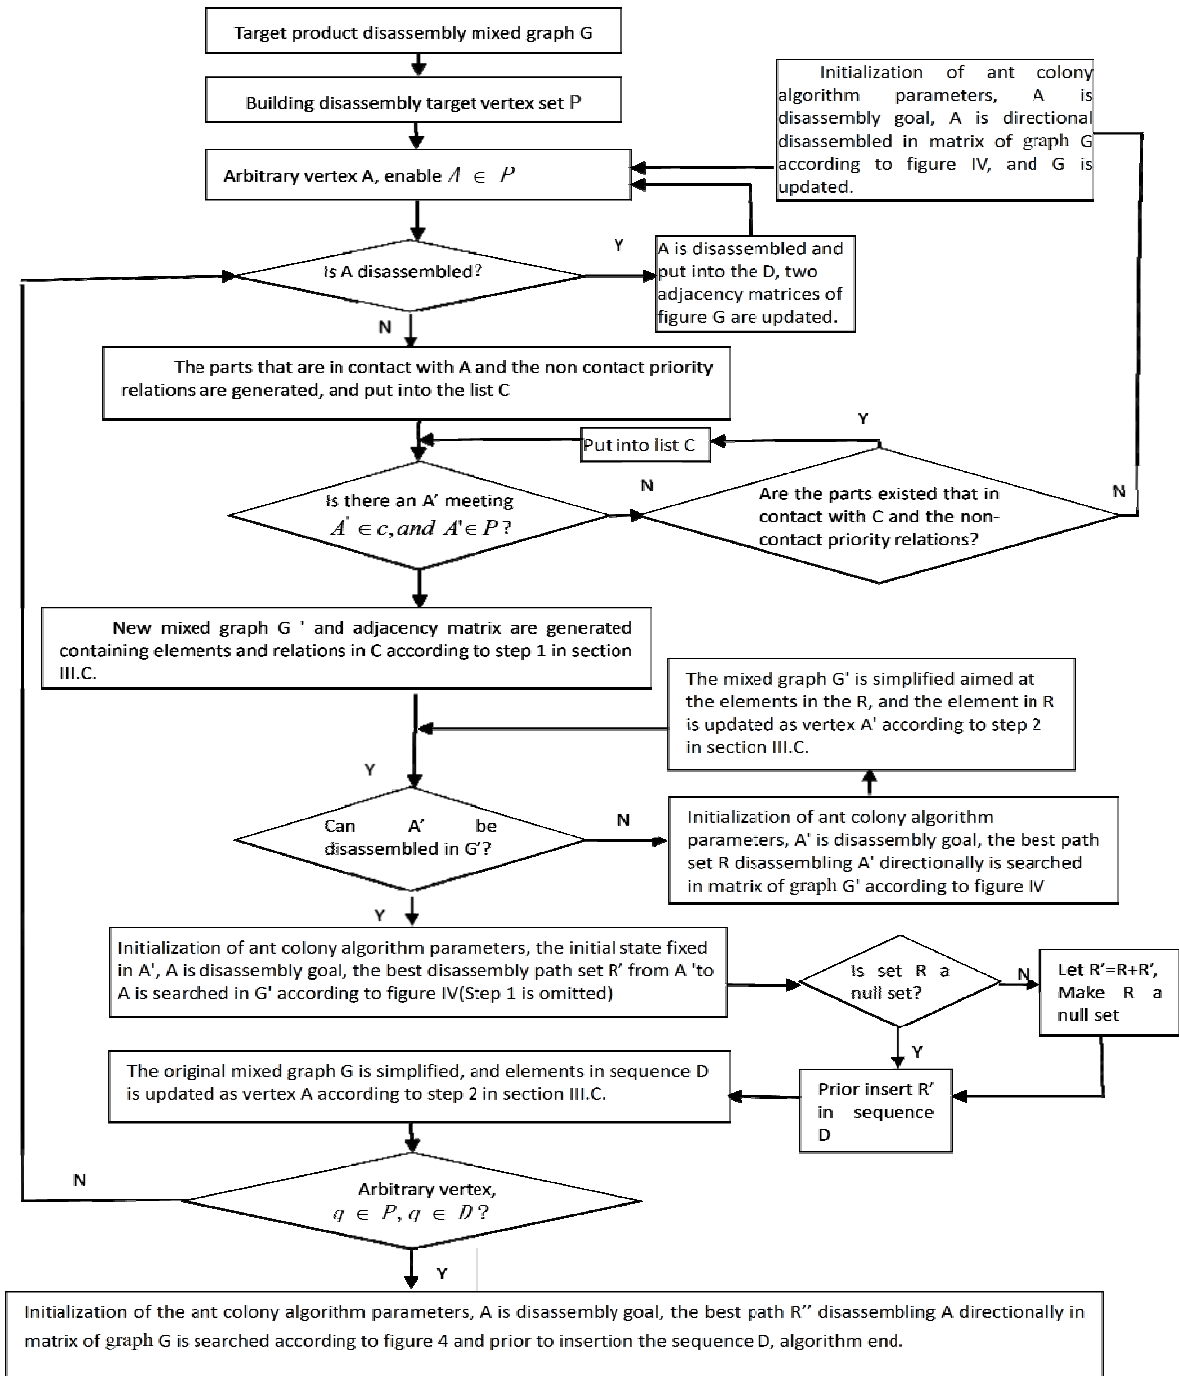

FIGURE III. PRODUCT MULTI-TARGET DIRECTIONAL DISASSEMBLY STRATEGY

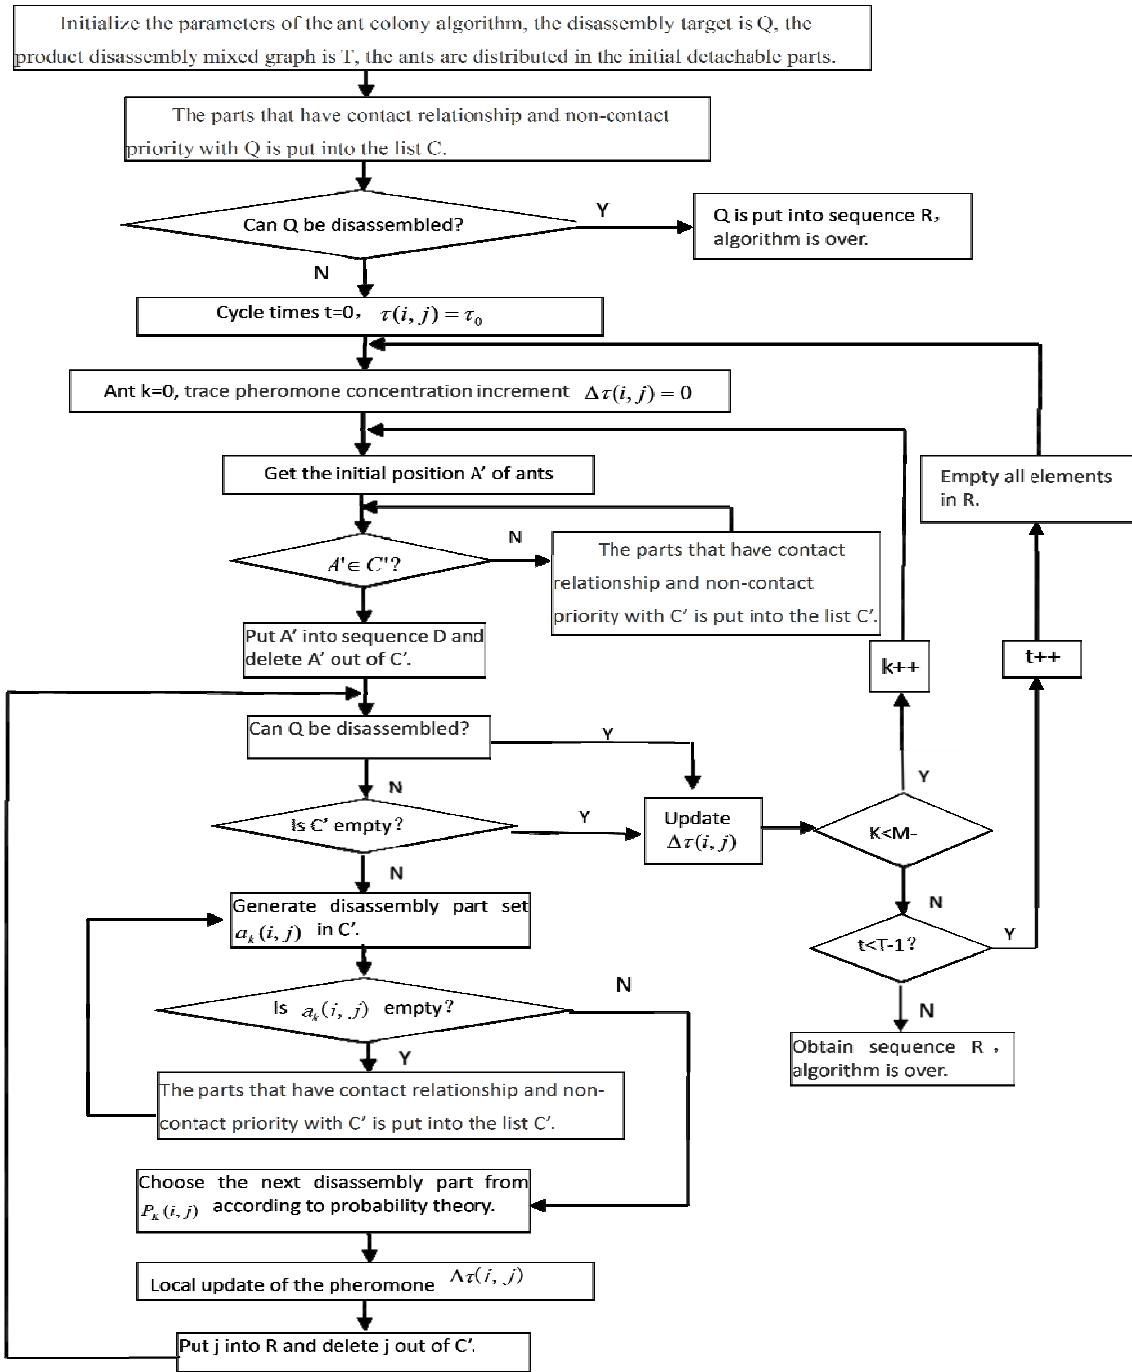

FIGURE IV. THE FLOW DIAGRAM OF ANT COLONY DISASSEMBLY ALGORITHM

IV. EXAMPLE

The algorithm is verified by disassembling the safety valve, thirteen parts can be disassembled for the safety valve, and the assembly figure is as Figure V. Time and cost that parts are disassembled is shown as Table I.

Three kinds of different disassembly multi-target set is respectively target vertex P_1 , P_2 and P_3 . $P_1=\{V_9(\text{screw}),$

$V_3(\text{gasket}), V_6(\text{nut})\}$, $P_2=\{V_2(\text{valve}), V_7(\text{spring}), V_{12}(\text{cover})\}$, $P_3=\{V_3(\text{gasket}), V_4(\text{bolt}), V_{10}(\text{nut})\}$.

The heuristic information $\eta(I, j)=[m \times \text{price}(i, j)+n \times \text{time}(I, j)]^{-\gamma}$, weight of unit part disassembly cost $m=0.65$, weight of unit part disassembly time $n=0.35$, $\gamma=1$, parameters of ant colony algorithm are as follows: $\alpha=2, \beta=5, \rho=0.6, C=2$,
