Keywords: Split general strongly nonlinear quasi-variational inequality problem; split general quasi-variational inequality problem; iterative algorithm; convergence

#### Abstract

In this paper, we introduce a split general strong nonlinear quasi-variational inequality problem which is a natural extension of a split general quasi-variational inequality problem, split variational inequality problem, quasi-variational and variational inequality problems in Hilbert spaces. Using the projection method, we propose an iterative algorithm for the split general strongly nonlinear quasi-variational inequality problem and discuss the convergence criteria of the iterative algorithm.The results presented here generalized, unify and improve many previously known results for quasi-variational and variational inequality problems.

## Introduction

Variational inequalities are a very powerful tool of the current mathematical technology and have become a rich source of inspiration for scientist and engineers. These have been extended and generalized to study a wide class of problems arising in mechanics, optimization and control problem, operations research and engineering sciences, etc. The development of variational inequality theory can be viewed as the simultaneous pursuit of two different lines of research. On the other hand, it enables us to develop highly efficient and powerful numerical methods to solve, for example, obstacle, unilateral, free and moving boundary value problems. In the last five decades, considerable interest has been shown in developing various classes of variational inequality problems, both for their own sake and for their applications.

An important generalization of the variational inequality problem is the quasi-variational inequality problem introduced and studied by Bensoussar, Goursat and Lions [1] in connection with impulse control problem. Recently, Kazmi [2] introduced and studied the following split general quasi-variational inequality problem (in short, SpGQVIP): For each $i \in\{1,2\}$, let $C_{i}: H_{i} \rightarrow 2^{H_{i}}$ be a nonempty, closed and convex set-valued mapping, $f_{i}: H_{i} \rightarrow H_{i}$ and $g_{i}: H_{i} \rightarrow H_{i}$ be nonlinear mapping and let A: $H_{1} \rightarrow H_{2}$ be a bounded linear operator with its adjoint operator $A^{*}$. Then the SpGQVIP is to find $x_{1}^{*} \in H_{1}$ such that $g_{1}\left(x_{1}^{*}\right) \in C_{1}\left(x_{1}^{*}\right)$ and

$$
\begin{equation*}
\left\langle f_{1}\left(x_{1}^{*}\right), x_{1}-g_{1}\left(x_{1}^{*}\right)\right\rangle \geq 0 \quad \text { for all } \quad x_{1} \in C_{1}\left(x_{1}^{*}\right), \tag{1}
\end{equation*}
$$

and such that $x_{2}^{*}=A x_{1}^{*} \in H_{2}, g_{2}\left(x_{2}^{*}\right) \in \mathrm{C}_{2}\left(x_{2}^{*}\right) \quad$ solves

$$
\begin{equation*}
\left\langle f_{2}\left(x_{2}^{*}\right), x_{2}-g_{2}\left(x_{2}^{*}\right)\right\rangle \geq 0 \quad \text { for all } \quad x_{2} \in C_{2}\left(x_{2}^{*}\right), \tag{2}
\end{equation*}
$$

SpGQVIP (1)-(2) amounts to saying: find a solution of general quasi-variational inequality GQVI (1) whose image under a given bounded linear operator is a solution of GQVIP (2).

If $g_{i}=I_{i}$, where $I_{i}$ is an identity mapping on $H_{i}, C_{i}(x)=\mathrm{C}_{i}$ for all $x_{i} \in H_{i}$, then SpGQVIP (1)-(2) is reduced to the following SpVIP:

Find $x_{1}^{*} \in C_{1}$ such that

$$
\begin{equation*}
\left\langle f_{1}\left(x_{1}^{*}\right), x_{1}-x_{1}^{*}\right\rangle \geq 0 \quad \text { for all } \quad x_{1} \in C_{1}, \tag{3}
\end{equation*}
$$

and such that $x_{2}^{*}=A x_{1}^{*} \in C_{2}$ solves

$$
\begin{equation*}
\left\langle f_{2}\left(x_{2}^{*}\right), x_{2}-x_{2}^{*}\right\rangle \geq 0 \text { for all } x_{2} \in C_{2} . \tag{4}
\end{equation*}
$$

SpVIP (3)-(4) has been introduced and studied by Censor, Gibali and Reich [3]. It is worth mentioning that the SpVIP (3)-(4) is quite general and permit split minimization between two spaces so that the imagine of a minimizer of a given function, under a bounded linear operator, is a minimizer of another function and it includes as a special case the split zero problem and the split feasibility problem which have already been studied and used in practice as a model in the intensity-modulated radiation therapy planning, see $[4,5,6]$ and the references therein.

In this paper, we introduced the following split general strongly nonlinear quasi-variational inequality problem: For each $i \in\{1,2\}$, let $C_{i}: H_{i} \rightarrow 2^{H_{i}}$ be a nonempty,closed and convex set-valued mapping, let $f_{i}: H_{i} \rightarrow H_{i}, h_{i}: H_{i} \rightarrow H_{i}$ and $g_{i}: H_{i} \rightarrow H_{i}$ be three nonlinear mapping and let A : $H_{1} \rightarrow H_{2}$ be a bounded linear operator with its adjoint operator $A^{*}$. Then we consider the problem: Find $x_{1}^{*} \in H_{1}$ such that $g_{1}\left(x_{1}^{*}\right) \in C_{1}\left(x_{1}^{*}\right)$ and

$$
\begin{equation*}
\left\langle f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right), x_{1}-g_{1}\left(x_{1}^{*}\right)\right\rangle \geq 0 \quad \text { for all } \quad x_{1} \in C_{1}\left(x_{1}^{*}\right), \tag{5}
\end{equation*}
$$

and such that $x_{2}^{*}=A x_{1}^{*} \in H_{2}, g_{2}\left(x_{2}^{*}\right) \in \mathrm{C}_{2}\left(x_{2}^{*}\right) \quad$ solves

$$
\begin{equation*}
\left\langle f_{2}\left(x_{2}^{*}\right)-h_{2}\left(x_{2}^{*}\right), x_{2}-g_{2}\left(x_{2}^{*}\right)\right\rangle \geq 0 \quad \text { for all } \quad x_{2} \in C_{2}\left(x_{2}^{*}\right) . \tag{6}
\end{equation*}
$$

We call problem (5)-(6) the split general strongly nonlinear quasi-variational inequality problem (in short, SpGSNQVIP).
Remark 1. If $h_{i}=0$, then SpGSNQVIP (5)-(6) is reduced to SpGQVIP (3)-(4).So the SpGSNQVIP (5)-(6) is the generalization of SpGQVIP(3)-(4).
Remark 2. Noting that general strongly nonlinear variational inequality problem $\left\langle f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right), x_{1}-x_{1}^{*}\right\rangle \geq 0, \forall x_{1} \in C_{1}$, is a important class of variational inequalities, which is the optimal condition of the following minimization problem:

$$
\min _{x \in C}\left(\frac{1}{2}\left\langle f_{1}(x), x\right\rangle-T_{1}(x)\right),
$$

where $T_{1}(x)=h_{1}(x)$. we denote the solution set of SpGSNQVIP (5)-(6) and the solution set of SpGQVIP (3)-(4) by $\Gamma_{1}$ and $\Gamma_{2}$, respectively.

## Iterative algorithms and convergence results

For each $i \in\{1,2\}$, a mapping $P_{C_{i}}$ is said to be the metric projection of $H_{i}$ on $C_{i}$ if for every point $x_{i} \in H_{i}$, there exists a unique nearest point in $C_{i}$ denoted by $P_{C_{i}}\left(x_{i}\right)$ such that

$$
\left\|x_{i}-P_{C_{i}}\left(x_{i}\right)\right\| \leq\left\|x_{i}-y_{i}\right\| \quad \text { for all } \quad y_{i} \in C_{i} .
$$

It is well known that $P_{C_{i}}$ is nonexpansive and satisfies

$$
\left\langle x_{i}-y_{i}, P_{C_{i}}\left(x_{i}\right)-P_{C_{i}}\left(y_{i}\right)\right\rangle \geq\left\|P_{C_{i}}\left(x_{i}\right)-P_{C_{i}}\left(y_{i}\right)\right\|^{2} \quad \text { for all } \quad x_{i}, y_{i} \in H_{i} .
$$

Moreover, $P_{C_{i}}\left(x_{i}\right)$ is characterized by

$$
\left\langle x_{i}-P_{C_{i}}\left(x_{i}\right), y_{i}-P_{C_{i}}\left(x_{i}\right)\right\rangle \leq 0 \quad \text { for all } \quad y_{i} \in C_{i} .
$$

Further, it is easy to see that the following fact: $x_{1}^{*}$ satisfied QVIP $\Leftrightarrow$ find $x_{1}^{*} \in C_{1}\left(x_{1}^{*}\right)$ such that

$$
\left\langle f_{1}\left(x_{1}^{*}\right), x_{1}-x_{1}^{*}\right\rangle \geq 0\left(\forall x_{1} \in C_{1}\left(x_{1}^{*}\right)\right) \Leftrightarrow x_{1}^{*}=P_{C_{1}\left(x_{1}^{*}\right)}\left(x_{1}^{*}-\rho_{1} f_{1}\left(x_{1}^{*}\right)\right), \rho_{1}>0 .
$$

Hence SpGSNQVIP (5)-(6) can be reformulated as follows: Find $x_{1}^{*} \in H_{1}$ with $x_{2}^{*}=A x_{1}^{*}$ such that $g_{i}\left(x_{i}^{*}\right) \in C_{i}\left(x_{i}^{*}\right)$ and
$g_{i}\left(x_{i}^{*}\right)=P_{C_{i}\left(x_{i}^{*}\right)}\left[g_{i}\left(x_{i}^{*}\right)-\rho_{i}\left(f_{i}\left(x_{i}^{*}\right)-h_{i}\left(x_{i}^{*}\right)\right)\right]$,
for $\rho_{i}>0$.
Based on the above arguments, we propose the following iterative algorithm for approximating a solution to SpGSNQVIP (5)-6).
Let $\left\{\alpha^{n}\right\} \subset(0,1)$ be a sequence such that $\sum_{n=1}^{\infty} \alpha_{n}=\infty$, and let $\rho_{1}, \rho_{2}, \gamma$ be the parameters with positive values.
Algorithm 1. Given $x_{1}^{0} \in H_{1}$, compute the iterative sequence $\left\{x_{1}^{n}\right\}$ by the iterative schemes:

$$
\begin{align*}
& g_{1}\left(y^{n}\right)=P_{C_{1}\left(x_{1}^{n}\right)}\left[g_{1}\left(x_{1}^{n}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{n}\right)-h_{1}\left(x_{1}^{n}\right)\right)\right],  \tag{7}\\
& g_{2}\left(z^{n}\right)=P_{C_{2}\left(A y^{n}\right)}\left[g_{2}\left(A y^{n}\right)-\rho_{2}\left(f_{2}\left(A y^{n}\right)-h_{2}\left(A y^{n}\right)\right)\right],  \tag{8}\\
& x_{1}^{n+1}=\left(1-\alpha_{n}\right) x_{1}^{n}+\alpha_{n}\left[y^{n}+\gamma A^{*}\left(z^{n}-A y^{n}\right)\right] \tag{9}
\end{align*}
$$

for all $n=0,1,2, \cdots, \rho_{1}, \rho_{2} \gamma>0$.
If $H_{i}=0$, then Algorithm 1 is reduced to the following iterative algorithm for SpGQVIP (3)-(4):
Algorithm 2. Given $x_{1}^{0} \in H_{1}$, compute the iterative sequence $\left\{x_{1}^{n}\right\}$ by the iterative schemes:

$$
\begin{align*}
& g_{1}\left(y^{n}\right)=P_{C_{1}\left(x_{1}^{n}\right)}\left[g_{1}\left(x_{1}^{n}\right)-\rho_{1} f_{1}\left(x_{1}^{n}\right)\right],  \tag{10}\\
& g_{2}\left(z^{n}\right)=P_{C_{2}\left(A y^{n}\right)}\left[g_{2}\left(A y^{n}\right)-\rho_{2} f_{2}\left(A y^{n}\right)\right],  \tag{11}\\
& x_{1}^{n+1}=\left(1-\alpha_{n}\right) x_{1}^{n}+\alpha_{n}\left[y^{n}+\gamma A^{*}\left(z^{n}-A y^{n}\right)\right] \tag{12}
\end{align*}
$$

for all $n=0,1,2, \cdots, \rho_{1,}, \rho_{2}, \gamma>0$.
If $g_{i}=I_{i}, C_{i\left(x_{i}\right)}=C_{i}\left(\forall x_{i} \in H_{i}\right)$, where $C_{i}$ is a nonempty closed convex subset of $H_{i}$, then Algorithm 2 is reduced to the following iterative algorithm for SpVIP (1)-(2):
Algorithm 3. Given $x_{1}^{0} \in H_{1}$, compute the iterative sequence $\left\{x_{1}^{n}\right\}$ by the iterative schemes:

$$
\begin{align*}
y^{n} & =P_{C_{1}}\left[x_{1}^{n}-\rho_{1} f_{1}\left(x_{1}^{n}\right)\right],  \tag{13}\\
z^{n} & =P_{C_{2}}\left[A y^{n}-\rho_{2} f_{2}\left(A y^{n}\right)\right],  \tag{14}\\
x_{1}^{n+1} & =\left(1-\alpha_{n}\right) x_{1}^{n}+\alpha_{n}\left[y^{n}+\gamma A^{*}\left(z^{n}-A y^{n}\right)\right] \tag{15}
\end{align*}
$$

for all $n=0,1,2, \cdots, \rho_{1,}, \rho_{2} \gamma>0$.
Remark 3. Algorithm2 and Algorithm3 are proposed by Kazmi in [2] and [7], respectively. Noting that Algorithm1 concludes them as special cases.
In order to obtain our main results, we need the following assumption, definition and lemmas.
Assumption 1. For all $x_{i}, y_{i}, z_{i} \in H_{i}$, the operator $P_{C_{i}\left(x_{i}\right)}$ satisfies the condition:

$$
\left\|P_{C_{i}\left(x_{i}\right)}\left(z_{i}\right)-P_{C_{i}\left(y_{i}\right)}\left(z_{i}\right)\right\| \leq v_{i}\left\|x_{i}-y_{i}\right\|
$$

for some constant $v_{i}>0$.
Definition 1. A nonlinear mapping $f_{1}: H_{1} \rightarrow H_{1}$ is said to be
(i) $\alpha_{1}$-strongly monotone with respect to $g_{1}: H_{1} \rightarrow H_{1}$ if there exists a constant $\alpha_{1}>0$ such that $\left\langle f_{1}(x)-f_{1}(y), \mathrm{g}_{1}(x)-g_{1}(y)\right\rangle \geq \alpha_{1}\|x-y\|^{2}, \forall x, y \in H_{1} ;$
(ii) $\beta_{1}-$ Lipschitz continuous if there exists a constant $\beta_{1}>0$ such that $\left\|f_{1}(x)-f_{1}(y)\right\| \leq \beta_{1}\|x-y\|, \forall x, y \in H$.
Remark 4. If $g_{1}=I_{1}$, where $I_{1}$ is an identity mapping on $H_{1}$, then definition 1 (i) is reduced to the definition of $\alpha_{1}$-strongly monotone of $f$.
Lemma 1.. Let $H$ be a real Hilbert space. Then the following inequalities hold:

$$
\|x+y\|^{2} \leq\|x\|^{2}+2\langle y, x+y\rangle, \forall x, y \in H ;\langle x, y\rangle=\frac{1}{2}\left(\|x\|^{2}+\|y\|^{2}-\|x-y\|^{2}\right), \forall x, y \in H .
$$

Lemma $2^{[8]}$. Assume that $\left\{a_{n}\right\}$ is a sequence of nonnegative numbers such that $a_{n+1} \leq\left(1-\gamma_{n}\right) a_{n}+\delta_{n}$, where $\left\{\gamma_{n}\right\}$ is a sequence in $(0,1)$ and $\left\{\delta_{n}\right\}$ is a sequence such that:
(i) $\sum_{n=1}^{\infty} \gamma_{n}=\infty$; (ii) $\lim \sup _{n \rightarrow \infty} \frac{\delta_{n}}{\gamma_{n}} \leq 0 \quad$ or $\quad \sum_{n=1}^{\infty}\left|\delta_{n}\right|<\infty$. Then $\lim _{n \rightarrow \infty} \alpha_{n}=0$.

Now we study the convergence of Algorithm1 for SpGSNQVIP (5)-(6).
Theorem 1. For each $i \in\{1,2\}$, let $C_{i}: H_{i} \rightarrow 2^{H_{i}} \frac{1}{2}$ be a nonempty, closed and convex set-valued mapping, let $g_{i}: H_{i} \rightarrow H_{i}$ be $\delta_{i}-$ Lipschitz continuous such that $\left(\mathrm{g}_{i}-\mathrm{I}_{i}\right)$ is $\sigma_{i}-$ strongly monotone, where $I_{i}$ is the identity mapping on $H_{i}$. Let $f_{i}: H_{i} \rightarrow H_{i}$ be $\alpha_{i}$-strongly monotone with respect to $g_{i}$ and $\beta_{i}-$ Lipschitz continuous. Let $h_{i}: H_{i} \rightarrow H_{i}$ be $\xi_{i}-$ Lipschitz continuous and let $A$ : $H_{1} \rightarrow H_{2}$ be a bounded linear operator and $A^{*}$ be its adjoint mapping. Suppose $x_{1}^{*} \in H_{1}$ is a solution to SpGSNQVIP (5)-(6) and Assumption 1 holds. Then the sequence $\left\{x_{1}^{n}\right\}$ generated by Algorithm 1 convergences strongly to $x_{1}^{*}$ provided that the constants $\rho_{i}$ and $\gamma$ satisfy the following conditions:

$$
\begin{aligned}
& \left|\rho_{1}-\frac{\alpha_{1}-k_{1} \xi_{1}}{\beta_{1}^{2}-\xi_{1}^{2}}\right| \leq \frac{\sqrt{\left(\alpha_{1}-k_{1} \xi_{1}\right)^{2}-\left(\delta_{1}^{2}-k_{1}^{2}\right)\left(\beta_{1}^{2}-\xi_{1}^{2}\right)}}{\beta_{1}^{2}-\xi_{1}^{2}}, k_{1}=\frac{\sqrt{1+2 \sigma_{1}}}{1+2 \theta_{2}}-v_{1}, \\
& \left|\alpha_{1}-k_{1} \xi_{1}\right|>\sqrt{\left(\delta_{1}^{2}-k_{1}^{2}\right)\left(\beta_{1}^{2}-\xi_{1}^{2}\right)}, \delta_{1}>\left|k_{1}\right|, \beta_{1}>\xi_{1}, \\
& 0<\theta_{2}=\frac{1}{\sqrt{1+2 \sigma_{2}}}\left\{v_{2}+\sqrt{\sigma_{2}-2 \rho_{2} \alpha_{2}+\rho_{2}^{2} \beta_{2}^{2}}+\rho_{2} \xi_{2}\right\}, \rho_{2}>0, \gamma \in\left(0, \frac{2}{\|A\|^{2}}\right) .
\end{aligned}
$$

Proof. Since $x_{1}^{*} \in H_{1}$ is a solution of SpGSNQVIP (5)-(6), $x_{1}^{*} \in H_{1}$ is such that $g_{i}\left(x_{i}^{*}\right) \in \mathrm{C}_{i}\left(x_{i}^{*}\right)$ and

$$
\begin{align*}
& g_{1}\left(x_{1}^{*}\right)=P_{C_{1}\left(x_{1}^{*}\right)}\left[g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right)\right)\right],  \tag{16}\\
& g_{2}\left(A x_{1}^{*}\right)=P_{C_{2}\left(A x_{1}^{*}\right)}\left[g_{2}\left(A x_{1}^{*}\right)-\rho_{2}\left(f_{2}\left(A x_{1}^{*}\right)-h_{2}\left(A x_{1}^{*}\right)\right)\right], \tag{17}
\end{align*}
$$

for $\rho_{i}>0$. It follows from Algorithm 1(7), Assumption 1 and (16) that

$$
\begin{align*}
&\left\|g_{1}\left(y^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\|=\left\|P_{C_{1}\left(x_{1}^{n}\right)}\left[g_{1}\left(x_{1}^{n}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{n}\right)-h_{1}\left(x_{1}^{n}\right)\right)\right]-P_{C_{1}\left(x_{1}^{*}\right)}\left[g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right)\right)\right]\right\| \\
& \leq\left\|P_{C_{1}\left(x_{1}^{n}\right)}\left[g_{1}\left(x_{1}^{n}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{n}\right)-h_{1}\left(x_{1}^{n}\right)\right)\right]-P_{C_{1}\left(x_{1}^{n}\right)}\left[g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right)\right)\right]\right\| \\
& \quad+\left\|P_{C_{1}\left(x_{1}^{n}\right)}\left[g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right)\right)\right]-P_{C_{1}\left(x_{1}^{*}\right)}\left[g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{*}\right)-h_{1}\left(x_{1}^{*}\right)\right)\right]\right\| \\
& \leq\left\|g_{1}\left(x_{1}^{n}\right)-g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{n}\right)-f_{1}\left(x_{1}^{*}\right)\right)\right\|+\rho_{1}\left\|h_{1}\left(x_{1}^{n}\right)-h_{1}\left(x_{1}^{*}\right)\right\|+v_{1}\left\|x_{1}^{n}-x_{1}^{*}\right\| \tag{18}
\end{align*}
$$

Noting that $f_{1}$ is $\alpha_{1}$-strongly monotone with respect to $g_{1}$ and $\beta_{1}$-Lipschitz continuous and $g_{1}$ is $\delta_{1}$-Lipschitz continuous, we have

$$
\begin{align*}
& \left\|g_{1}\left(x_{1}^{n}\right)-g_{1}\left(x_{1}^{*}\right)-\rho_{1}\left(f_{1}\left(x_{1}^{n}\right)-f_{1}\left(x_{1}^{*}\right)\right)\right\|^{2} \\
& =\left\|g_{1}\left(x_{1}^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\|^{2}-2 \rho_{1}\left\langle f_{1}\left(x_{1}^{n}\right)-f_{1}\left(x_{1}^{*}\right), g_{1}\left(x_{1}^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\rangle+\rho_{1}^{2}\left\|f_{1}\left(x_{1}^{n}\right)-f_{1}\left(x_{1}^{*}\right)\right\|^{2} \\
& \leq\left(\delta_{1}^{2}-2 \rho_{1} \alpha_{1}+\rho_{1}^{2} \beta_{1}^{2}\right)\left\|x_{1}^{n}-x_{1}^{*}\right\|^{2} \tag{19}
\end{align*}
$$

Combining (18) and (19), we get

$$
\begin{equation*}
\left\|g_{1}\left(y^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\| \leq\left\{\sqrt{\delta_{1}^{2}-2 \rho_{1} \alpha_{1}+\rho_{1}^{2} \beta_{1}^{2}}+\rho_{1} \xi_{1}+v_{1}\right\}\left\|x_{1}^{n}-x_{1}^{*}\right\| \tag{20}
\end{equation*}
$$

Since $\left(g_{1}-I_{1}\right)$ is $\sigma_{1}$-strongly monotone, by virtue of Lemma $1(1)$, we have

$$
\begin{aligned}
\left\|y^{n}-x_{1}^{*}\right\|^{2} & \leq\left\|g_{1}\left(y^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\|^{2}-2\left\langle\left(\mathrm{~g}_{1}-\mathrm{I}_{1}\right) y^{n}-\left(\mathrm{g}_{1}-\mathrm{I}_{1}\right) x_{1}^{*}, y^{n}-x_{1}^{*}\right\rangle \\
& \leq\left\|g_{1}\left(y^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\|^{2}-2 \sigma_{1}\left\|y^{n}-x_{1}^{*}\right\|^{2},
\end{aligned}
$$

Which implies that

$$
\begin{equation*}
\left\|y^{n}-x_{1}^{*}\right\|^{2} \leq \frac{1}{\sqrt{1+2 \sigma_{1}}}\left\|g_{1}\left(y^{n}\right)-g_{1}\left(x_{1}^{*}\right)\right\| . \tag{21}
\end{equation*}
$$

It follows from (20) and (21), we have

$$
\begin{equation*}
\left\|y^{n}-x_{1}^{*}\right\| \leq \theta_{1}\left\|x_{1}^{n}-x_{1}^{*}\right\| . \tag{22}
\end{equation*}
$$

where $\theta_{1}=\frac{1}{\sqrt{1+2 \sigma_{1}}}\left\{\sqrt{\delta_{1}^{2}-2 \rho_{1} \alpha_{1}+\rho_{1}^{2} \beta_{1}^{2}}+\rho_{1} \xi_{1}+v_{1}\right\}$.
Similarly, we obtain

$$
\begin{equation*}
\left\|g_{2}\left(z^{n}\right)-g_{2}\left(A x_{1}^{*}\right)\right\| \leq\left\{\sqrt{\delta_{2}^{2}-2 \rho_{2} \alpha_{2}+\rho_{2}^{2} \beta_{2}^{2}}+\rho_{2} \xi_{2}+v_{2}\right\}\left\|A y^{n}-A x_{1}^{*}\right\| \tag{23}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\|z^{n}-A x_{1}^{*}\right\| \leq \theta_{2}\left\|A y^{n}-A x_{1}^{*}\right\| . \tag{24}
\end{equation*}
$$

Where $\theta_{2}=\frac{1}{\sqrt{1+2 \sigma_{2}}}\left\{\sqrt{\delta_{2}{ }^{2}-2 \rho_{2} \alpha_{2}+\rho_{2}{ }^{2} \beta_{2}{ }^{2}}+\rho_{2} \xi_{2}+v_{2}\right\}$.Furthermore, in view of Algorithm 1(9), we have

$$
\begin{equation*}
\left\|x_{1}^{n+1}-x_{1}^{*}\right\| \leq\left(1-\alpha_{n}\right)\left\|x_{1}^{n}-x_{1}^{*}\right\|+\alpha_{n}\left[\left\|y^{n}-x_{1}^{*}-\gamma A^{*}\left(A y^{n}-A x_{1}^{*}\right)\right\|+\gamma \| A^{*}\left(z^{n}-A x_{1}^{*} \|\right] .\right. \tag{25}
\end{equation*}
$$

Observe that $A^{*}$ is a bounded linear operator with $\|A\|=\left\|A^{*}\right\|$ and the given condition on $\gamma$, we get

$$
\begin{align*}
\left\|y^{n}-x_{1}^{*}-\gamma A^{*}\left(A y^{n}-A x_{1}^{*}\right)\right\|^{2} & =\left\|y^{n}-x_{1}^{*}\right\|^{2}-2 \gamma\left\langle y^{n}-x_{1}^{*}, A^{*}\left(A y^{n}-A x_{1}^{*}\right)\right\rangle+\gamma^{2} \| A^{*}\left(A y^{n}-A x_{1}^{*} \|^{2}\right. \\
& \leq\left\|y^{n}-x_{1}^{*}\right\|^{2}-\gamma\left(2-\gamma\|A\|^{2}\right)\left\|A y^{n}-A x_{1}^{*}\right\|^{2} \leq\left\|y^{n}-x_{1}^{*}\right\|^{2} . \tag{26}
\end{align*}
$$

And using (24), we have

$$
\begin{equation*}
\left\|A^{*}\left(z_{n}-A x_{1}^{*}\right)\right\| \leq\|A\|\left\|z_{n}-A x_{1}^{*}\right\| \leq \theta_{2}\|A\|\left\|A y^{n}-A x_{1}^{*}\right\| \leq \theta_{2}\|A\|^{2}\left\|y^{n}-x_{1}^{*}\right\| \tag{27}
\end{equation*}
$$

From (25)-(27) that

$$
\left\|x_{1}^{n+1}-x_{1}^{*}\right\| \leq\left[1-(1-\theta) \alpha^{n}\right]\left\|x_{1}^{n}-x_{1}^{*}\right\| .
$$

Where $\theta=\theta_{1}\left(1+\gamma\|A\|^{2} \theta_{2}\right)$. It follows from the conditions on $\rho_{1}, \rho_{2}$ and $\gamma$ that $\theta \in(0,1)$. Thus $\left\{(1-\theta) \alpha^{n}\right\} \subset(0,1)$ and $\sum_{n=1}^{\infty}(1-\theta) \alpha^{n}=\infty$ for $\sum_{n=1}^{\infty} \alpha^{n}=\infty$. So it follows from Lemma 2 that $\left\{x_{1}^{n}\right\}$ converges strongly to $x_{1}^{*}$ as $n \rightarrow \infty$. Since $A$ is continuous, it follows from(20), (22), (23) and (24) that $g_{1}\left(y^{n}\right) \rightarrow g_{1}\left(x_{1}^{*}\right), y^{n} \rightarrow x_{1}^{*}, A y^{n} \rightarrow A x_{1}^{*}, g_{2}\left(z^{n}\right) \rightarrow g_{2}\left(A x_{1}^{*}\right)$, and $z^{n} \rightarrow A x_{1}^{*}$ as $n \rightarrow \infty$. This completes the proof.
If $h_{i}=0$, then Theorem 1 reduced to the following result of the convergence of Algorithm 2 for SpGQVIP (10)-(11).
Corollary 1. For each $i \in\{1,2\}$, let $C_{i}: H_{i} \rightarrow 2^{H_{i}}$ be a nonempty,closed and convex set-valued mapping, let $g_{i}: H_{i} \rightarrow H_{i}$ be $\delta_{i}-$ Lipschitz continuous such that $\left(\mathrm{g}_{i}-\mathrm{I}_{i}\right)$ is $\sigma_{i}-$ strongly monotone, where $I_{i}$ is the identity mapping on $H_{i}$. Let $f_{i}: H_{i} \rightarrow H_{i}$ be $\alpha_{i}$ - strongly monotone with respect
to $g_{i}$ and $\beta_{i}$ - Lipschitz continuous. Let $A: H_{1} \rightarrow H_{2}$ be a bounded linear operator and $A^{*}$ be its adjoint mapping. Suppose $x_{1}^{*} \in H_{1}$ is a solution to SpGQVIP (1)-(2) and Assumption 1 holds.Then the sequence $\left\{x_{1}^{n}\right\}$ generated by Algorithm 2 convergences strongly to $x_{1}^{*}$ provided that the constants $\rho_{i}$ and $\gamma$ satisfy the conditions:

$$
\begin{aligned}
& \left|\rho_{1}-\frac{\alpha_{1}}{\beta_{1}^{2}}\right| \leq \frac{\sqrt{\alpha_{1}^{2}-\beta_{1}^{2}\left(\delta_{1}^{2}-k_{1}^{2}\right)}}{\beta_{1}^{2}}, \alpha_{1}>\beta_{1} \sqrt{\delta_{1}^{2}-k_{1}^{2}}, \quad k_{1}=\left[\frac{\sqrt{1+2 \sigma_{1}}}{\sqrt{1+2 \theta_{2}}}-v_{1}\right], \delta_{1}>\left|k_{1}\right|, \\
& 0<\theta_{2}=\frac{1}{\sqrt{1+2 \sigma_{2}}}\left\{v_{2}+\sqrt{\sigma_{2}^{2}-2 \rho_{2} \alpha_{2}+\rho_{2}^{2} \beta_{2}^{2}}\right\}, \rho_{2}>0, \gamma \in\left(0, \frac{2}{\|A\|^{2}}\right) .
\end{aligned}
$$

If $C_{i\left(x_{i}\right)}=C_{i}\left(\forall x_{i} \in H_{i}\right)$, where $C_{i}$ is a nonempty closed and convex subset of $H_{i}, g_{i}=I_{i}, h_{i}=0$, then Theorem 1 reduces to the following convergence result of Algorithm 3 for SpVIP(3)-(4).
Corollary 2. For each $i \in\{1,2\}$, let $C_{i}$ be a nonempty,closed and convex subset of $H_{i}$. Let $f_{i}: H_{i} \rightarrow H_{i}$ be $\alpha_{i}$ - strongly monotone and $\beta_{i}-$ Lipschitz continuous. Let $A: H_{1} \rightarrow H_{2}$ be a bounded linear operator and $A^{*}$ be its adjoint operators. Suppose $x_{1}^{*} \in H_{1}$ is a solution to SpVIP (3)-(4). Then the sequence $\left\{x_{1}^{n}\right\}$ generated by Algorithm 3 converges strongly to $x_{1}^{*}$ provided that the constants $\rho_{i}$ and $\gamma$ satisfy the conditions:

$$
\left|\rho_{1}-\frac{\alpha_{1}}{\beta_{1}^{2}}\right| \leq \frac{\sqrt{\alpha_{1}^{2}-\beta_{1}^{2}\left(1-k_{1}^{2}\right)}}{\beta_{1}^{2}}, \alpha_{1}>\beta_{1} \sqrt{1-k_{1}^{2}}, k_{1}=\frac{1}{1+2 \theta_{2}}, k_{1}<1, \quad \theta_{2}=\sqrt{1-2 \rho_{2} \alpha_{2}+\rho_{2}^{2} \beta_{2}^{2}} .
$$
