

# Study on Research of Women and Child's Development

Hao Yong  
Xi'an Fanyi University  
Xi'an, China

**Abstract**—Whether it is foreign or domestic, preschool education is very important to the society, the school and the family. They pay attention to the development of the young child while women are the key factor. The article will state the importance of the female to the child's development and analyses the reason of the child's development. And then it gives some suggestions to improve the child's development.

**Keywords**—women; the child's development; reason; factor

## I. INTRODUCTION

The "long-term reform and development of the State plan (2010-2010)" made it clear that preschool education should be playing the important position. Preschool education is the beginning of the lifelong education, is the important part of the modern educational system. But it is weaker in all kinds of education. It promotes the development of the preschool education, is related to the healthy growth of hundreds of millions of children, and is related to the vital interests of millions of families and the future of the country and nation. The females play the role in the child's development.

## II. THE IMPORTANCE OF WOMEN TO THE CHILD'S DEVELOPMENT

From ancient times to now, many great men have a great mother behind them. Such as China, there are the three mothers of the Western Zhou Dynasty, the Meng mother of the Warring States period, the pottery mother of the Jin Dynasty, the Liu mother of the Tang Dynasty, and the mother-in-law of the Song Dynasty. All of the cases tell us that there is the close relationship between the female and the child.

### A. The Necessary Conditions for Child Development

From a physiological point of view, embryos of sperm and egg need mothers to provide a good "living environment". Such as, mother's body, spirit, habits and hobbies and other factors, they will affect the growth of the fetus during pregnancy. If the fetus is stimulated by a good environment in the pregnancy, the factors s will be better developed, such as temperament and body. However, if the fetus is stimulated by a bad environment in the pregnancy, the factors will change. So the physical of women will affect the development of the fetus, and at the same time, it will also have a certain impact on the development of children.

### B. The Main Undertakers of the Early Child Upbringing

From the perspective of the development history of preschool education, child's education mainly adopted the mode of "public education and public support" because of the low level of productive forces in primitive society. As the productivity level of agricultural society is raised, family is the key to the education of young children. Because of the advent of mechanized production in industrial society, more women are going to the society for certain work tasks. Therefore, the problem of preschool education is slowly pushed to the society. However, women are taking care of the number of children in the children's career. It still accounts for the majority.

From a psychological point of view, the general anxiety and other anxiety symptoms of children are closely related to the relationship between mother and child attachment. A good mother child relationship helps children to reduce their anxiety level, construct a positive and healthy mental environment, and develop good social skills and interpersonal relationships.

## III. FACTOR

### A. The Concept of Women

"Mother is the first teacher of children". Whether women ideas are advanced or not, it will inevitably affect the development of children. In traditional thinking, women are more concerned about children' body, food, clothing, and other issues. About children' learning problems, children may learn and accept advanced ideas if the family conditions permit. While the family conditions are not allowed, children cannot be improved. For example, the early childhood education is relatively popular in China. According to the survey, there are about 52% families who pay attention to early childhood education in first line and second line cities. And most of them are women who go to early education institutions. However, the cities with three lines are less concerned about early childhood education, and some even do not set up early education institutions. It can be seen that the advanced concept of women promotes the healthy growth of physical and mental health of the children.

### *B. The Comprehensive Quality of Women*

Whether it is social education, school education or family education, women bear the education of children. Women and children are getting along with longer time; meanwhile they have more opportunities for communication. Therefore, the quality of women will directly affect the quality of children. According to the survey, women with high educational level are far superior to those with low educational background in raising children. A woman with a higher education level has stronger self-control ability, a higher level of culture, wider horizons and rich knowledge. The highly educated women have more understanding of the characteristics of children's physical and mental development; have more skills, more confidence, the scientific method of nurturing, and a variety of ways to solve the problem. And they are good at using the effective resources around them for me, so that children can effectively solve the children.

### *C. The Raising Way of Women*

With the development of economy, the role of women has changed. By the role of women from the tradition to the workplace, more and more women go to the society and participate in the work. Raising children are looked after by the husband and wife.

## IV. METHOD

### *A. Renew Ideas*

Idea is the guider of behavior. When women have a new concept, they can combine the current new form and carry out education for children. Women should constantly update their ideas, keep learning and keep pace with the times. "Without passion, no great cause can start well. Without reason, no heroic deeds can end well. "In the process of educating children, women should have new ideas and methods of education. They are good at discovering the advantages and interests of the children, cultivating the good habits of children, and constantly stimulating and promoting the development of the inherent potential of the children.

### *B. Constantly Improve the Comprehensive Quality*

According to the relevant studies, the brain weight of an adult is about 1400 grams, while a 4 year old child has 1000 grams of brain weight. It is a period of intellectual development before 5 years old. For an 18 year old child, 50% of its intelligence was acquired before the age of 4. Female is first teacher to the child. In order to cultivate the children consciousness of survival, talent, competition and global awareness, women should learn and improve themselves constantly. And then they can promote the child's physical and mental health and harmonious development.

### *C. Having a Scientific and Reasonable Educational Method*

Women are often the master of a family, especially in the education of children, which bear the unshakably responsibility. They have a direct impact on the education of children. Therefore, women should give full play to their

delicate, comprehensive and accurate perception and thinking ability, and continue to explore and analyze children's physical and mental characteristics, interests, and personality development. Women continue to constantly improve themselves. They can help the children to explore scientific and reasonable methods and means of education, to carry out effective education to their children, to stimulate and promote their curiosity, and so on.

## V. CONCLUSION

Froebel, a German educationalist, once said, "the destiny of a nation is not so much in the hands of those in power, but rather in the hands of the mother. Therefore, we must enlighten the mother - the educator of mankind." Only by constantly learning and renewing ideas, living scientifically, respecting children, self-confidence and solidarity and cooperation, female can improve the children' overall and harmonious development and cultivate their sound personality.
