Abstract. in the medical level of rapid development today, the hospital internal management of the requirements of the work of nature is also improving. For the past relatively, extensive management mode in the present is not applicable, this paper will be how to realize the fine management as the goal, the specific studies focused on the application aspects of financial management information platform for the construction of the former situation and construction target, and summarizes the specific process, the final list its actual effect.

Keywords: financial management; Information platform; The hospital; Fine management.

1. Management Without the Application of Financial Management Information Platform

1.1 Financial and Business Systems are Isolated from Each Other

In the absence of the application of financial management information platform, the internal financial system and business system of the hospital are in an isolated state, which will lead to the data update is not timely enough, and it is easy to cause some errors in the data between the two. Its specific performance can be discovered by many examples of the actual situation, first of all in financial general ledger and prone to discrepancy among each department independent accounts, secondly in terms of cost budget, due to containing the contents of the various kinds of cost budget, this will lead to the same task node cost budget of weak consistency, in order to reduce the impact of this issue, all of the cost accounting data need to spend a lot of human liquidation, not only reflect the advantage of information technology, also will waste a lot of manpower material resources[1].

1.2 Loose Material Management Process

Similarly, in the absence of the application of financial management information platform, the management of other materials has not been comprehensively information-based, except for the consumables valued by the hospital. Such performance is firstly reflected in the purchase of materials. In the aspect of procurement, the lack of budget leads to the shortage or surplus of materials, which will affect the treatment of patients, while the excess of materials may lead to the failure of materials due to the expiration date. In addition, the incorrect application of the financial management information platform is likely to lead to errors in the amount of goods to be received in the procurement stage, which will also lead to the above two situations. In addition, problems cannot be traced back to the source and solved.

1.3 Lack of Personnel Management

Problems in personnel management mainly focus on the lack of a complete management system. Therefore, personnel do not do the most suitable work according to the most suitable system. When personnel need to be changed, the human resources department cannot make a correct response in the first time. In order to describe the correct responsibilities of HRM departments in hospitals, the following paragraphs will be presented in the form of pictures, as shown in figure 1 for details.

Figure 1. function diagram of hospital human resources department

1.4 Insufficient Asset Management

Finally, the most practical problem is that the asset management is not in place. The asset can refer to the valuable medical equipment in the hospital or the circulating capital inside the hospital. However, no matter which aspect of the asset, there will be a lot of problems in the application of financial management information platform. First of all, in terms of expensive medical instruments, there will be problems such as equipment cannot be maintained on time, malfunction and normal maintenance. In addition, there will be confusion in the accounts of circulating funds, and there will be situations that are inconsistent with the reality when budget planning is needed for the future capital situation[2].

2. Significance of Application of Financial Management Information Platform

In the detailed management of the hospital, the primary purpose of applying the financial management information platform is to connect the two independent management systems of finance and business in the past, to speed up the efficiency of the hospital and strengthen the real-time supervision of all lines within the hospital. These four main routes determine the efficiency and development prospect of the hospital, which will be shown in the form of chart below, see figure 2 for details. Through the analysis of these four main lines, it is found that they correspond to the management requirements of human, material and financial resources within the hospital. Starting from these three aspects, problems in the management of the hospital can be solved to a large extent.

3. Application Process of Financial Management Information Platform

3.1 Solid Foundation

To solid foundation can be found in the original foundation platform on the basis of the construction of the system framework, which will be two aspects of the system at the same time, this can be taken to set up the means of material warehouse, the types of goods warehouse natural also need to have the corresponding classification, specific classification can be divided into health supplies warehouse, consumables and office supplies, disinfection supplies warehouse warehouse, by this means can be all flow to the information management system of unified planning, so as to realize the purpose of the process real-time monitoring. In order to show the detailed process, the following will be shown as a picture, as shown in figure 3.

Figure 3. flow chart of material management

All the links in the above figure need to start the next item after the previous work is completely completed, otherwise the process lacks practical significance.

3.2 Strengthen the Responsibility System

In the process of strengthening the responsibility system, all the business details should be sorted out again at the first place. In the initial stage of data entry, complete statistics should be conducted to ensure that the cause of the problem can be identified quickly and quickly in the case of relevant problems [3]. To this end, before the financial statements become effective, it is necessary to repeatedly confirm that there are no errors in the case of submission. In the process of accounting and reimbursement, relevant documents and procedures should be matched one by one, including recording bills, warehousing records and leaders' signature, etc., to ensure that the platform's data can be satisfied by such means.

3.3 Normative Process

Finally, when the process is standardized, the hospital will make a unified budget plan for all expenses, and in order to ensure the accuracy of its budget, unified data is needed. When it comes to the unified management of data, whether electronic documents or entity documents are used, financial work needs to be divided in detail to achieve the unified management of data. In order to show the specific situation of financial work division in detail, it will be displayed in the form of pictures, as shown in figure 4 for details.

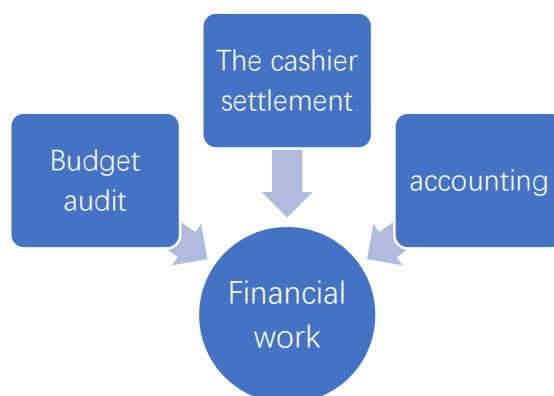

Figure 4. detailed division of financial work

The relationship between the three tasks in the figure above should not only achieve specific coordination, but also have certain internal communication ability, otherwise, it is likely to slow down the efficiency of work due to repetitive labor.

4. Application Results of Financial Management Information Platform

4.1 Improvement of Data Accuracy

After the specific application of financial management information platform in the process of hospital management, the most obvious result is that its data accuracy has been improved to a considerable extent. Sources of data are becoming more transparent than in the past, allowing departments to agree on data, and solving problems such as fees and drug inventories more easily. With the improvement of accuracy, many errors in the past work have been corrected, and the overall quality of data reaches the peak value [4].

4.2 Improve Business Efficiency

At the same time, after the use of financial management information platform, the purchasing department, finance department and related department contact close enough problems of the three parties has been largely alleviate, but on this basis, not to work appear to ignore the details of the situation, but use, is more simple statistical method to eliminate the deviation of the data for the past a lot of repeated meaningless work is avoided, the efficiency of business nature is improved.

4.3 Improvement of Management Ability

Finally, as mentioned above, has been applied in the financial management information platform, the cost budget work and financial management work is an organic combination, which makes the relatively closed management environment got some change, and along with the application of electronic technology, its streamline operation level also in unceasing enhancement, the people involved in factors of less and less, in the largest extent, reduces the likelihood of errors, it also promote the management ability from the side.

5. Conclusion

Through the discussion of this paper, the fine management to financial management information platform in the hospital of the existing significance of related is discussed, and put forward some specific process and the present achievements, hope that through the concrete process of summarize related work to make a certain contribution for the future, but its results for its work incentive effect, the elaborating management in hospital become more perfect.
