Abstract - As a giant and complicated project, the construction of Shibaozhai Breakwater in Chongqing needs subtle prediction of its stability and reliability. Such work is with great difficulty. However, by using artificial neural network under the MATLAB, we use the measured dataset to model the stability and reliability of the Breakwater project thus to forecast the index concerned.

Index Terms - Artificial neural network; MATLAB; Breakwater; Application Research.

1. Introduction

With huge investment, the construction of Chongqing Shibaozhai Breakwater project matters the security of Shibaozhai. Therefore it significant to anticipate its stability and reliability with precision. The measured data are collected in the process of construction by BGK steel stress meter and Inclinometer. With rapid development of artificial neural network theory, its application in structure reliability analysis gradually attains great focus. Artificial neural network is a nonlinear system made up of enormous processing units, which enjoys lots of advantages like: flexible adaptability, self-organization, quick learning ability, fault-tolerance, and anti-disturbance ability. It also can create efficient model directly based on sampled data[1] by avoid the complicated mechanism of an unknown system.

However, the realization of the network model needs high proficiency of the programmer and researcher, which ,to some extent, hinders the coverage and promotion of artificial neural network. To solve this problem, the use of MATLAB neural network toolkit is introduced to saves certain programming and debugging time. Thus the research can be concentrated on the modeling of the urgent problem, with great improvement in efficiency.[2]

2. Basic Principal And Procedure

The following are the analyses of measured data. We preprocess on the original data, use command premnmrx(p) normalize data p (-1,1), then set up initial network, and train the network with data. Here we adopted Levenberg- Marquardt Algorithm, because it is very fast for the middle scale BP neural network, and Convergence error is small. Other network parameter set as: net.trainparam.epochs=2000 ; net.trainparam.goal=0.001 ; net.trainparam.show=20 ; net.trainparam.lr=0.6 ; net.trainparam.mc=0.6. Finally we use well-trained neural network, according to the time series, to

proceed 20 times Monte Carlo simulation, and anticipate the future 5 steps[3].

From TABLE 2-7 and Fig.1-36, we can see prediction data nearly match the measured data, and prediction data show Breakwater project is stable and reliable.

3. Conclusion

By the analysis of relation of Measured data---frequency and stresses1 stresses2----we can see the different parts have strong relevance, incidence relation Consistent and reliable. TABLE 9 are correlation coefficient matrix of frequency temperature stresses1 stresses2, TABLE 10 are matrix of Covariance.

TABLE 9 correlation coefficient matrix

	frequency	temperature	stresses1	stresses2
frequency	61930.77			
temperature	24.86801	40.34717
